Devoted to Dairying and Dairy Stock Interests.

VOLUME XXXIV. FORT ATKINSON, WIS., FEBRUARY 13, 1903. NUMBER 1

W. I. Young & Co., Wholesale Dealers in Fine **Butter, Cheese and Eggs**
Liberal Advancements Made on Consignments.
Refer by permission to Irving National Bank, N. Y. 149 Reade Street, New York.

ASK YOUR DEALER IN DAIRY SUPPLIES FOR
CHR. HANSEN'S LACTIC FERMENT
To ripen your cream, ensuring
Perfect Flavor, Uniformity and Keeping Qualities in your Butter.
CHR. HANSEN'S LABORATORY, P. O. Box 1003, Little Falls, N. Y.

A Good Record
TEN CAR LOADS
which means in this case twenty-four thousand nine hundred tubs sold to one co-operative Dairy Company in Minnesota, between Feb. 1899 and July 1902, and in using them they did not lose one tub out of the entire lot. We have their letter stating this to be a fact.
This is how our GENUINE "Elgin" Tub stands up.
Made only by the ELGIN BUTTER TUB CO. at Elgin, Ill.
Schmidt Bros., Props.

HOUSE **SAVOGRAN** FOR CLEAN CLEANING **INDIA ALKALI WORKS, BOSTON**
Medals—Bronze, 1878 Silver, 1887, World's Fair, 1893.

WORCESTER SALT
IS THE BEST
The largest Creamery in the world uses WORCESTER SALT, and—this telegram tells the rest:
"Kansas City, Mo., March 7, 1902.
WORCESTER SALT CO.,
168 Duane St., New York.
Continental won sweepstakes, also State cup trophy at Kansas Dairymen's meeting; score Ninety-Eight. Worcester Salt used ten highest scores.
G. A. McEDWARDS."
IT TAKES THE TO MAKE THE **BEST**
WORCESTER SALT COMPANY,
168 DUANE STREET, NEW YORK.

You Will Always Know Your Own
if you mark your stock with the old reliable **Dana's White Metallic Ear Labels.** They don't pull out, can't be rubbed off, and will not wear out in 10 years. Can always be easily read. Forty recording associations use them as official labels. I sell thousands each year to the best farmers, breeders and veterinarians in the country. Owner's name, address and consecutive numbers stamped on each tag. It saves all mistakes and annoyance in your records of breeding, births, transfers, etc. Sample free. Agents wanted.
C. H. DANA,
55 Main St., W. Lebanon, N. H.

DON'T Place Your Order For **-ROOFING-** Until You Have Seen **CAREY'S** Magnesia Flexible Cement **ROOFING**
It Can't Be Equalled for Durability.
For Flat or Steep Roofs
QUICKLY APPLIED.

Sample Cut and full information mailed upon request, Free.
The Philip Carey Mfg. Co., 19 Wayne, Lockland, O.

MARK YOU
your live stock of whatever kind with the thoroughly reliable, rust proof, non corroding, easily read....
ALUMINUM
"STAY THERE" **EAR MARKERS**
Can't pull out, rust out or tear out. Name, address and consecutive numbers on each tag. Free sample, catalog etc. WILCOX & HARVEY MFG. CO. 196 Lake St. CHICAGO, ILL

DOUBLE CAM **BRADLEY STEEL HAY PRESS**
One horse can operate it. Very easy for two.
NOT A COG NOR CHAIN ABOUT IT.
Send for circular.

Simplest Press Made.
Lifting Jack goes with each Press. Powerful—puts full weight into box car. Tracks with a wagon; 2 horses draw it on common roads.
Has an AUTOMATIC PLUNGER DRAW.
DAVID BRADLEY MFG. CO., 116 E. Broadway BRADLEY, ILL.

DEMAND

THERE is never a demand for anything without a reason. The demand for the **Tubular Dairy Separators** during the month just passed has been greater than the demand for all other cream separators combined during any previous January. The reason is that the superiority of the **Tubular** has become generally recognized and other separators can only be sold to those who are looking for something cheap in price. The manufacturers of the old fashioned, complicated separators have come to the point where they are forced to admit the inferiority of their machines, and are selling them for less than the **Tubulars** because they know they are worth less. Cheap in price does not mean cheap in value by any means and those who investigate find that the **Tubular** should sell for more than any other separator, **because it is worth more.**

The Tubular skims more closely than other separators. The Tubular requires much less power than other separators. The Tubular can be cleaned much quicker than other separators. The Tubular is more simple and convenient than other separators. The Tubular is the only separator with a low down supply can, a bottom-fed, small diameter bowl and that oils itself automatically.

BOYS WANTED!

We want a boy in every town to work for us after school hours and on Saturdays.

Over 3000 boys now at the work. Some make $10.00 to $15.00 a week.

ANY BOY

who is willing to devote a few hours each week to this work can earn many dollars selling

The Saturday Evening Post

Among neighbors and relatives. He can begin at once. **Absolutely no money required to start.** Write us to-day and we will send the first week's supply of ten copies free. These are sold at 5 cents each, and will provide capital to order the next week's supply at wholesale rates.

$225 in Extra Cash Prizes Next Month

Booklet containing photographs of some of our most successful boy agents, with letters telling how they work, sent free.

The Curtis Publishing Company
455 Arch Street, Philadelphia, Pa.

Cold Blast Lanterns.

They burn fresh cold air and that means strong, pure white, steady light. For perfect convenience and safety, there is nothing that will so certainly suit your needs as

The DIETZ Blizzard

It is the cold blast kind. It can't blow out. Just the right size, and its generous oil pot runs it 19 hours with one filling. It's the all-service, all-season lantern to go with you and make the way plain about a hundred household duties. Side lever raises the globe for trimming, lighting and extinguishing, and then lowers and locks it to the burner for absolute safety. Look for **Dietz** stamped on the oil pot when you go to buy. If it's not there don't take it. The dealer will get you a **Dietz.** Write for our free catalogue to choose.

R. E. Dietz Company,
94 Laight Street, New York.
Established 1840.

ASBESTINE

is the fireman's friend. Things don't burn that are painted with **Asbestine fire and water-proof**

Cold Water PAINT.

Other advantages—costs only one-fourth what oil paint does. Neither cracks, scales or blisters, and adheres to any surface. Made in white and all colors. Mixes with cold water. Anybody can apply it. Ask the dealer for it. Write us for prices, tint cards, etc.

The Water Paint Company of America,
Dept. A-6, 100 William St. New York.

RUPTURE CURED while you work. You pay $4 when cured. No cure, no pay. ALEX. SPEIRS, Box 846, Westbrook, Me.

Using Liquid Manure.

ED. HOARD'S DAIRYMAN:—Will you or some reader give me a little advice which I need in regard to liquid manure. I find that under the cow barns, on a farm purchased by myself last year, are two cisterns, 7 ft. wide, 50 ft. long and 5 or 6 ft. deep, filled to overflowing with full strength liquid manure. I know not how long it has been accumulating but concluded, after my discovery, that although a good deposit, it had better be put out where I can realize something from it.

1. How many gallons shall I put on an acre of land? My land is quite level and in very good condition.

2. Will it do to put it on the frozen ground this winter without loss?

3. Which will be the best thing to do, retain these vaults or fill them and save the liquid by absorbtion? A. B. C.

East Onondaga, N. Y.

The manure liquor can be applied to land at the rate of 500 gallons per acre. It should be applied in the spring or at times when there is sufficient rain to carry it into the soil, as in dry seasons there is danger of burning the plants. For the average farmer the use of liquid manure is too expensive a method of applying fertility to the land as it contains on an average about 4 per cent of fertilizing material and the large amount of water present makes it expensive to handle. It is cheaper to use absorbents.

"FEEDS and FEEDING" ....

A HANDBOOK FOR THE STUDENT AND STOCKMAN.

By W. A. HENRY, Dean, College of Agriculture, Madison, Wis.

This large octavo volume of 663 pages is the only book extant which summarizes all of the feeding investigations of all of the experiment stations of both the New and the Old world. It presents the latest discoveries of the scientist, and is replete with the practical experiences of the best stockmen. The information is arranged in the most helpful and readable manner possible.

PRICE $2.00 PER COPY POSTAGE PAID.

For Sale by HOARD'S DAIRYMAN.

valid distinction, but one that is too frequently overlooked.

There are four distinct breeds of dairy cattle, and we give typical illustrations of them on this page. While dissimilar in many respects, so much so that one cannot be mistaken for another, there is a very marked similarity in outline and general conformation.

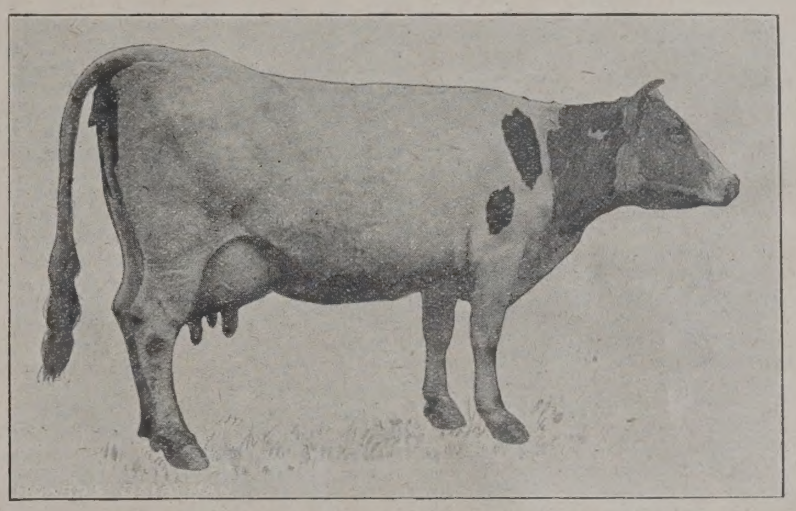
This outline and conformation constitute what dairymen denominate the dairy type. It may sometimes be found in cows not belonging to either of these four breeds, but wherever found, it indicates dairy capacity in the individual. The difference between the cow of this conformation, of no special breeding, and the dairy bred cow is, that the former has a mixed heredity and her offspring is liable to take back to ancestors that had no dairy ability, whereas the pure bred cow is practically certain to transmit the special qualities which distinguish the breed she represents.

A TEXAS AUTOMO—BULL.
Property of WHITE & SONS, Bonham, Texas.

A Texas Automo—bull.

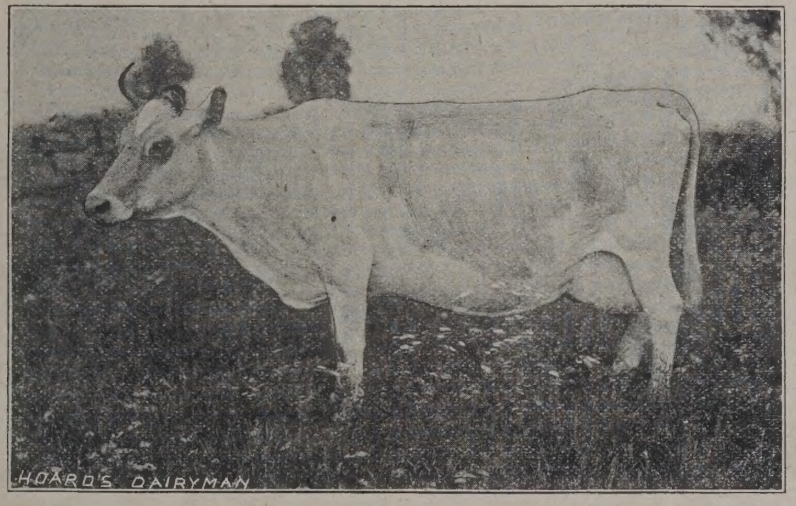
ED. HOARD'S DAIRYMAN:—We send you picture of Pride's Exile of St. L. No. 53648 A. J. C. C. as he appeared as a 3-year-old in the Bonham Trades display of Aug. 1900. There was advertised to be an automobile in the procession, which failed to arrive, so the next best thing was thought to be an automo-bull. We had only two hours to get up a rig, which was an old buggy. Pride had never been driven; had been ridden, and worked on horse power. To our surprise he moved off like a trained circus horse. He is the sire of 104 calves, 68 of which are heifers. All his heifers that are in milk are far superior to their dams.

Bonham, Texas. WHITE & SONS.



called to order by Mr. E. N. Bailey, who after a few well chosen remarks introduced L. P. Bailey, President of the Ohio State Dairymen's Association.

Mr. Bailey reviewed the history of Ohio as a cheese producing state from 1860 to the present time. Mr. Bailey said that in the sixties, Ohio had the reputation in our home and foreign markets of producing a first-class cheese and at that time the western factorymen shipped their cheese through Ohio and placed them on the market as Ohio cheese. At that time Ohio was making a full cream cheese, but later on the Ohio people took pattern after their western friends and commenced making a skim-milk cheese and in a short time lost their reputation for making a first-class cheese and our export trade fell off 40 per cent, while Canada's export trade increased 40 per cent. Mr. Rice of Triumph, Trumbull Co., Ohio, adopted making a full cream cheese and received a gold medal on his cheese at the Paris Exposition.



Mr. Bailey reviewed the work of the Ohio State Dairymen's Association, how that they had caused the passage of laws prohibiting the sale of filled and skim milk cheese for full cream cheese; compelling the manufacturer to brand their cheese according to the amount of butter fat that they contained. This killed the filled cheese industry and helped us to regain our lost reputation.

Prof. Noyes spoke in regard to the cheese industry in Wisconsin. He said there were 1600 cheese factories in the state which manufactured sixty million pounds of cheese annually; when they first started in the dairy business had no dairy school; said they first started to make a full cream cheese, but later on began skimming a little, and increased until finally they run the milk though the separator, and made a full skim cheese, which they were compelled to sell for one cent per pound.

The leading dairymen saw that something must be done and they established a State Dairymen's Association, and through their influence laws were passed prohibiting the branding of filled cheese, as full cream. The result is that Wiscon-

Ohio State Dairymen's Association.

ED. HOARD'S DAIRYMAN:—The local meeting of the Ohio State Dairymen's Association held at Rock Creek, Ohio, December 30, 1902, under the auspices of the McJunkin-Straight Dairy Co., was

85823

sin cheese commands the highest price in our markets at the present time.

Prof. Noyes said that all first-class creamery butter was as good as Elgin butter; that the Babcock test had done more for the dairymen than any one thing ever introduced. No cheese could be properly cured in a high, dry curing room; should be cured in a basement well ventilated and held at a temperature of 60 to 65°; all curing rooms in Wisconsin were basements. The per cent of butter fat in milk cannot be increased by feed. Silage was a good feed for the dairy cow, but should always be fed after milking.

Prof. Vivian, the next speaker, said that milk was a complete food for the young, but was not an ideal food for an adult. There were several cases on record where a cow gave milk without ever giving birth to a calf. Nervous excitement during milking, always decreased the per cent of butter fat as well as the quantity of milk; first milk never contained as much fat as the after milk or strippings; the cow's udder was responsible for the amount of butter fat in the milk. The average yield of milk per cow in America was 3,000 pounds; but ought to be 5,000 pounds, the color of milk is due partly to the butter fat and partly to lactro-chrome. Good milk should not contain less than 4 per cent butter fat. All fat in milk is in fine globules; one drop of milk contains from 150 to 300 million globules of fat. There is a difference in the breed about the size of the globules. The Jersey and Guernsey cows give larger globules than other breeds. If a cow was half fed or starved, the per cent of butter fat might be increased by feed; methods of milking as to regularity, kindness, etc., will increase the per cent of butter fat.

The afternoon session opened at 1 o'clock p. m. Prof. Decker spoke on the quality and care of milk, showing that milk that was rich in butter fat, contained more casein than milk that was low in butter fat, making 4 per cent milk more valuable for cheese purposes than 3 per cent milk; not wholly because 4 per cent milk made more cheese, but it made a better quality. The first milk drawn from the cow contained all the bacteria. Filth on the cow's udder carried a great deal of bacteria in the milk. Germs in milk multiplied very rapidly, unless the milk is cooled immediately after it is drawn from the cow. He recommended that as soon as the milk is drawn from the cow it be removed from the stable, aerated and cooled. Cooling the milk arrests the growth of germs. One hundred cases of typhoid fever had been traced to the use of milk that had not been properly cared for and cooled.

Prof. Noyes spoke on the testing of milk in Wisconsin by the Babcock test. Patrons of creameries were willing to sell milk by the test, while patrons of cheese factories were not. The Wisconsin Dairy School had demonstrated by actual tests that 4 per cent milk was worth more for cheese purposes than 3 per cent milk. Samples for testing should be taken from weighing can every day, put into the composite jar and tested once a week. Cows will vary in the per cent of butter fat every day. Cheese factories in Wisconsin that paid their patrons by the Babcock test paid more for milk than factories that paid by weight, showing a great advantage to those who sold by the test because they produced a better quality of milk.

President Bailey then spoke on the care of the dairy cow and milk. He said that he positively knew that if the farmers of Ohio would take better care of their milk and cows, that they would get enough better prices for their milk to more than pay them for the extra labor. A great deal of trouble was caused by not taking proper care of the milk can. Never turn the can bottom side up after washing, but always set it right side up to air. It was absolutely necessary to aerate milk as soon as it was drawn from the cow, and never mix warm milk with cold milk before delivering it to the creamery.

Mr. Simons spoke briefly. He said he always liked to meet with the farmers and was always interested in their work. He thought that every farmer should be a constant reader of agricultural papers and keep posted or he will find farming a poor investment.

At the evening session, Mr. Bailey said that it was necessary for the dairy cow to have a warm stable. He described a cheap, convenient stable. Make a tight floor three feet and one half back from the manger, then make a trench 3 feet wide and 18 inches deep. Cover this trench with wooden grating 1¼ in. apart to allow all the liquids and most of the solids to drop through into ditch. Hang gratings on hinges so they will raise up and turn back against side of stable at time of cleaning out trench.

With this device the cows will keep much cleaner than with the open drop. No dairyman could afford to be without a silo; always build the silo outside the barn. There was more difference in the care of the cow than in the breed; good, kind treatment was more necessary than the breed. Always milk regularly; stop everything else, and attend to the milking and feeding on time. Some cows require different feed than others. We must study the needs of our cows, and supply them, if we wish to be successful dairymen.

Mr. Bailey advised turning the cow out to water to give her exercise; exercise was necessary to health and improved the appetite; a cow being freah in the fall would give one-third more milk than if fresh in spring. He had proved by actual experience that he could produce milk cheaper in the winter than summer.

At the close of the session, the following resolutions were adopted:

Resolved First, That we heartily appreciate the work of the Ohio State Dairymen's Ass ciation in holding local meetings, and would earnestly ask our legislature to continue its appropriation for this purpose,

Second, That the present standard of 20 per cent fat is too low, and it is our opinion that the standard for full cream cheese be raised to 30 per cent fat.

Third, That we thank President Bailey, Profs. Noyes, Decker and Vivian for their interesting and instructive lectures.

J. S. MATSON
S. STOUGHTON, Committee.
E. R. WILLIAMS.

Footville, Ohio.

Where Ignorance is Bliss.

ED. HOARD'S DAIRYMAN:—"Where ignorance is bliss, 'tis folly to be wise." Can we believe that that is true since reading Farmer (?) Carlin's letter on page 1011? No, I can't see anything blissful about such stuff as that.

How can a man, after reading HOARD'S DAIRYMAN for six months make the assertion that balanced rations will not make more milk than the "any old way" feeding does?

Does he take it that all who, in their letters, tell of their increased profits are untruthful? Has he tried a balanced ration and failed to get better returns? If so, he misused, if not abused, his cows during the trial. Did he ever read your question: "Will it pay you to take HOARD'S DAIRYMAN?" Which he can find after the table of contents, for instance on page 1002?

Does he wish to be a 66 cent man? Or does he wish to become a farmer who has affectionate friends as well as money makers in his cows? Does he wish to support his ten cows, or does he wish them to support him?

I think he will find that HOARD'S DAIRYMAN is turning the dairy business right side up, at least that is what you are doing for me. I have not received one single issue since last July, that I would or could afford to part with for a dollar, the subscription price for a whole year, could I not replace it.

The "neighbor" whom Mr. Carlin speaks of must be a philanthropist to loan his paper for six months to a man, who from choice is as ignorant as he wishes to appear.

As for me, I see bread and butter (good butter mind you, not oleomargarine) in every issue.

May God speed the DAIRYMAN, and may we all awaken to see our best interests in dairying, as well as other lines of husbandry. And if we are humane in our treatment of our cows, my word for it, that they will respond with a full milk pail.

Hoping our friend will awaken, and thanking you for the vast amount of information that you are weekly preparing for us. I have the honor to remain a life-long subscriber. O. A. L.

Olympia, Wash.

An Ohio Dairy Herd.

ED. HOARD'S DAIRYMAN:—As we have been taking and are careful readers of your most valuable paper for over two years, have not as yet seen any account of what our part of the country is doing in dairying. We are located in the western part of Licking county, 14 miles east of the capital city of our state, Columbus, O.

It will be three years this coming May since the Summit Co-operative Creamery Co. opened its doors to its patrons. A year later they established in connection a skimming station at Jersey, a nearby village, having at present nearly a hundred patrons delivering milk at each place, being paid for the butter fat by the Babcock test. The patrons all seem to be well pleased with their results and everything working fine.

I will give you a record of our little herd for the year 1902, consisting of 4 full blood and 5 high grade Jerseys, two heifers with first calf, 3 with second calf, and 4 matured cows. Their rations for the five winter months consisted of clover hay and corn stover for roughage, and from 6 to 10 lbs. ground corn and cob meal, oats and bran, equal parts in bulk; stabled 5 months, turned out on nice days. We count our skim milk worth 20 cents per 100, but it has been worth considerable more, as we have raised 5 fine heifer calves on skim milk alone, and sold 14 head of pigs that averaged 227 lbs. at 7 months old, which received the milk the calves didn't get. In my opinion skim milk is very much undervalued as a stock food.

The cost of keep of cows, $34 per head; received milk, butter and cash as follows:

MONTH.	Milk.	Test.	Butter.	Price.	Cash.
Jan	260	5.8	15.08	.24	$ 3.62
Feb	1,194	4.9	58.50	.26	15.21
March	3,854	4.4	169.576	.25	42.39
April	4,883	4.5	219.735	.26	57.13
May	6,440	4.8	309.12	.22	68.01
June	6,2 8	5.1	318.648	.20	63 73
July	5,082	4.9	249.018	.20	49.80
Aug	5,169	4.9	253.281	20	50.66
Sept	4,035	5.4	217 89	.21	45.76
Oct	3,124	6.2	193.688	.23	44.55
Nov	1,903	6.3	119.889	.27	32.37
Dec	1,426	6.4	91.262	.25	22.81
Total	43.618		2215 693		$496 04

Skim milk	$ 69.78
Four veal calves	$ 25.05
Total cash for herd	$590.87
Average milk per cow	4846.4 lbs.
" butter " "	246.18 lbs.
" net cash "	$65.65
" cost keep "	$34 00
Average net profit per cow	$31.65

We own a fine, full blood sire at the head of our herd, from which we are raising our young cows.

Summit Station, O. J. T. & J. M. M.

N. C. B. A. Executive Committee.

ED. HOARD'S DAIRYMAN:—It gives me pleasure to inform your readers that President Nietert has appointed his Executive Committee. In selecting the below named Committee he has studied the best interests of the Association.

Mr. J. S. Moody, of St. Paul, represents the wholesale butter interests; Mr. W. F. Jensen of the Continental Creamery Co., Topeka, Kans., who is a practical buttermaker, represents the Proprietary Creamery interests, and C. D. Elder, of Manchester, Iowa, also a practical butter maker and one of the pioneers in Iowa, represents the Co-operative Creamery interests.

All the members of the Executive Committee are so well and favorably known throughout the country that it goes without saying, that they will give us the best meeting next October we have ever held.

The first meeting of the Committee will be held at the Grand Hotel, Cedar Rapids, Iowa, February 3rd, when offers from cities who wish the next Convention will be received and considered.

E. SUDENDORF, Sec.
National Creamery Buttermakers' Assn.

No Matter What Its Company

may be, butter will be preserved through commission houses and markets as well as in the household, if it is wrapped in our

Pioneer Brand Parchment Paper.

Outside smells and odors never penetrate through it, and it shuts in all the delicious flavor. Preserves butter better and longer than by any other means. If you make good butter you may get the name of so doing by letting us print your name, dairy or brand on every sheet. It never rubs off or discolors butter, and you can have no more effective advertisement. Parchment paper samples will quickly convince you of their value. Send for them. Sent free. Ask also for copy of our free book, entitled "Better Butter."

THE PATERSON PARCHMENT PAPER CO.,
No. 37 8th Street, Passaic, N. J.

Indiana State Dairy Association.

ED. HOARD'S DAIRYMAN:—In point of interest, the 13th annual convention of the Indiana State Dairy Association was one of the best ever held. The creamerymen were much more in evidence than ever before. The meeting was held at Purdue University, LaFayette, Jan. 21-23.

The entries were:

CREAMERY BUTTER.

Herbert Newby, Spiceland (silver cup)	97½
Anton Bueler, Barnes, Ill	97¼
John Enger, Osceolo	91¼
W. S. Hastings, Sullivan	90½
J. F. Penrod, Plymouth	90
C. E. Holderman, Bremen	90
E. L. Martin, New Carlisle	89½
Frank Leneck, Hanna	88

DAIRY BUTTER.

Mrs. Sam'l Martin, LaFayette (silver cup)	94
Mrs. E. S. Hobart, Williamsport	91½
Mrs. Jerome Dunlap, LaFayette	88½
Mrs. Chas. Lamont, Joppa	88
Laura Jessup, Carmel	88
Isaac Brown, Decatur	86¾

CHEESE.

Boyd & Drischel, Cambridge City (silver cup)	92
G. P. Swan, New Washington	91
A. E. Helmer, Evans Mills, N. Y.	89
P. G. Yoars & Sons, Amboy	88

Essays on cost of producing butter:

Mrs. Chas. Lamont, Joppa, 1st. J. M. Hack, Crown Point, 2d.

Resolutions were adopted commending the work of the Department of Agriculture, in its enforcement of the Oleo and Renovated Butter Laws, the National Dairy Union, E. Sudendort's candidacy for Supt. of Dairy Dept. at St. Louis Exposition. Approving the equipment of the Dairy Dept. at Purdue University and urging the establishment of a dairy herd. Calling on the legislature to provide for a chemical laboratory to make possible the carrying out of pure food laws.

The following officers were elected:

Sam'l Schlosser, Plymouth, Pres.; G. V. Woolen, Indianapolis, Vice-Pres.; H. E. VanNorman, LaFayette, Sec. and Treas.

H. E. VAN NORMAN.

LaFayette, Ind.

Grass Seed for Wet Land—Lime.

ED. HOARD'S DAIRYMAN:—I have a field which I wish to seed in the spring; it was an old pasture. I plowed it last spring and sowed it to millet, but it was so wet that I did not get much of a crop. I expect to sow it to oats and seed it down; it is quite wet land. What kind of seed had I better sow for a permanent meadow? I have heard foul meadow grass was good for wet land. I want something that will not freeze out in winter. Would slacked lime be good to put on this field? I expect to purchase a car load of lime for next spring's use. I have another field. Do you think the lime would be good for ensilage corn, if I spread it broad-cast, harrow it in, and sow corn in drills? This field had a good coat of manure last year. I also expect to plant part of it to potatoes.

Rockland, N. Y. J. W. J.

A mixture of alsike clover, red top, and one of the grasses peculiar to low lands, such as meadow Fescue or meadow foul grass.

It is a rather uncertain term to say that a piece of land is wet, as this ranges from land where the above grasses will grow, to that only fit for sedges. However, the above grasses are well adapted to wet meadow land. As to whether the above land needs lime, can only be determined by examination. If the soil is so acid as to turn blue litmus paper red, the use of lime is indicated.

Lime should be used sparingly where it is expected to grow potatoes, as the liability of scab is much increased in an alkaline soil.

As a rule, lime is likely to be most beneficial on sour, peaty soils, and those having large amounts of undecomposed vegetable matter, or on heavy, clayey lands, in conjunction with coarse, strawy manures, but the only way to decide such matters decisively is to try in small amounts and watch the results.

A California Feeding Problem.

Will it Pay to Feed Grain?

ED. HOARD'S DAIRYMAN:—Would it pay me to feed my cows grain, or a balanced ration. I will state the conditions of my herd, and there are hundreds of others in this valley situated much as I am. During 1902, kept a herd of 12 grade Holstein cows, of which 5 were young heifers. They have never had a feed of grain in their lives, or much of anything except alfalfa. They have alfalfa pasture with some alfalfa hay during the spring, summer and fall. For the winter months they have all the alfalfa hay they will eat, and sometimes a little green feed or pumpkins or pie mellons, but hay is the main feed. My cows have averaged 6,612 pounds of milk for 1902, testing 3.5½ butter fat, for which we receive at local cheese factory, 26 cents per pound on an average per year. This makes me $60+ per cow per year. Do you think it would pay me to sell choice alfalfa hay at $5 per ton, and buy middlings at $20 per ton, or corn or barley at the same price to make up a balanced ration. R. R. B.

Hanford, Cal.

Until quite recently, basing our opinions upon reports from different sources in California and other coast states, we have thought that it did pay to feed more or less grain with alfalfa, but at the recent meeting of the California Dairy Association, it was reported that there is quite a pronounced sentiment in favor of depending upon alfalfa alone. It was not contended that in this way, the largest amount of milk was secured, but that prices current for the extra milk obtained from feeding grain were not sufficient to pay the extra cost.

It would seem to us to be a very practical and practicable thing for this inquirer and others situated like him to make experiments along this line, not alone for their own satisfaction and guidance, but to be reported through our columns for the consideration of others. Select two or three cows of the herd, keep an accurate record of the milk yielded on alfalfa alone for some weeks, and then commence to feed moderate amounts of barley and bran or ground wheat and bran or oats or other grains that may be be available, and note what the results are. It has always been contended that a good dairy cow could not eat enough hay to enable her to do her best. Of course, alfalfa makes exceptional hay and it may prove to be an exception to the general rule.

"ADVERTISEMENT."

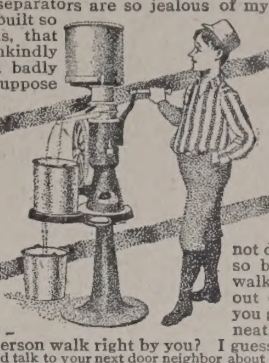
THE LUNCH QUESTION.

How a Big Chicago Firm Solved It.

So many employes "bolt the lunch" and eat what they should not, that they soon show the effect in nervousness and dyspepsia. This has attracted the attention of managers of the big stores and shops. In one Chicago firm an experiment on some of the girls resulted in a complete solution of the question.

The woman that made the experiment tells the tale as follows: "About a year ago I became alarmed at the state of my daughter's health. She was employed by a big firm here and for some reason steadily lost flesh, grew very nervous, had no appetite and could not sleep.

"Questioning her I found she ate but little lunch for at that busy hour she was seldom served promptly and the time being short she just "bolted" the food and rushed back. She ate very light breakfasts and I could see she suffered from lack of nourishment. I felt responsible for this and finally got her some Grape-Nuts for breakfast.

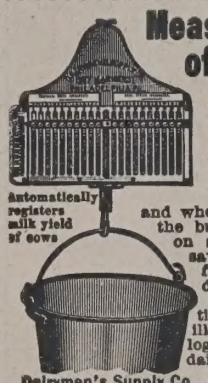


"I also got a neat leather case holding two pint flasks. One I filled with milk, the other with cold Postum Coffee which had been properly made. She also carried a package of Grape-Nuts. The Postum she drank iced with a dash of lemon. She followed the Grape-Nuts with some fruit and this made up her lunch.

"In spite of the warm weather she improved greatly in two weeks' time. She gained in flesh, her nerves were steady and she slept sweetly at night. She never felt the old weakness from hunger.

"In a short time a few other girls in the office tried it and the effect was so marked upon all that still others were persuaded. Finally a room was cleared out and the one hundred and odd girls were served daily with Grape-Nuts and hot Postum. It was a revolution but the manager saw the good result and adopted the plan, greatly to the benefit of the health of the employes and at a saving in expense." Name given by Postum Co., Battle Creek, Mich.

My Name is Empire No. 2



I am a twin brother of the **Cream Separator Queen, Empire No. 1 A,** but being a boy I can do more work. I am light. Only have a very few parts in my make up, and when it comes to turning and caring for me I am a "dead easy" proposition. All Cream Separator users who have tried me are my friends, but still I am not without enemies. Some big, heavy, complicated cream separators are so jealous of my appearance and of the fact that I am built so simple and have so few parts, that they can't keep from talking unkindly of me. But then I don't feel badly about it. I pity them. Just suppose you weighed two hundred pounds; had been taking

anti-fat all your life without getting any lighter; could not dress neat on account of being so big and clumsy and couldn't walk half a block without getting out of breath; wouldn't it make you green with envy to have some neat, well dressed, sprightly, nicely proportioned person walk right by you? I guess you would be too provoked to say "Good morning!" too, and would talk to your next door neighbor about "How awfully slim Mrs. So and So is." **Well I'm the Slim One.** I'm not loaded down with a ton of useless cast-iron, cog wheels, bushings, bearings, tin plates, corrugated tin pipes and complicated tubes. If I was I'd take a physic, and if it didn't do anything else it might better my disposition anyway. I'm only one of a large family. I have brothers and sisters smaller and larger. Our book gives history of the whole "Empire" family. Send for it.

(Formerly U. S. Butter Ex. Co.) **EMPIRE CREAM SEPARATOR CO., Bloomfield, N. J.**

Measure the Milk of each Cow

With the Automatic Milk Scale you can keep an accurate record of the yield of each cow, and remove the unprofitable ones from the dairy. Each button on scale arm corresponds to number of cow, and when pail of milk is weighed the button registers the weight on score card. Big money saver and money maker for farmers and dairymen. Send for testimonials and illustrated catalogue of Bestov dairy supplies.

WILL IT PAY YOU TO TAKE HOARD'S DAIRYMAN?

W. H. Jenkins took a census in 1901 of 50 farmers who were patrons of the creamery in Montrose, Pa. Twenty-five of them read dairy papers; twenty-five did not. The twenty-five who did read dairy papers averaged $50.23 per cow for the year. The twenty-five who did not read averaged $32.95. Here is a difference of $17.28 per cow. Did it pay the twenty-five to read? Did it pay the other twenty-five not to read? That's not all. Those who did read averaged a profit over cost of food of $15.06 per cow. Those who did not read averaged a profit of 66 cents. Is not that dairy farmer standing greatly in his own light who will not pay 2 cents a week for Hoard's Dairyman? These are hard facts worth thinking over.

Coming Events.

Wisconsin Buttermaker's Association, Waukesha, Wis., Feb. 24-26, 1903.
Ohio Dairymen's Convention, Columbus, State, University, Feb. 12-13, 1903.
Wisconsin Dairymen's Convention, Fond du Lac, Feb. 11-13, 1903.
Texas Dairymen's Convention, College Station, July, 1903

A train load of twenty-four cars filled with the Sharpless Tubular Hand Separators, left the factory at West Chester, Pa., for the west, on Jan. 31. When it is considered that this shipment is the product alone af one firm, and that the other separator firms are all doing their best to keep up the same demand, we may secure some idea of how rapidly the change to the farm separator system is taking place all over the country. When HOARD'S DAIRYMAN made the prophecy, over ten years ago, that sooner or later this would be the leading creamery system of the country, it was received with a good deal of skepticism, but it seems to be coming along.

A REFLECTION.

HOARD'S DAIRYMAN has a very choice set of subscribers, a selected lot of men and women in the agricultural field, to work for. Some of them write us very cheery, hopeful letters. They take a sane, healthy view of their business. They love their work and they love good sunlight, good pure air, water, and good dairy reading anything that is good and will help them do their work better, and so win better profit from it.

Then there is another class who go to their work unwillingly. They really have no love for it; they see nothing in it but drudgery, mere slave labor. They have no relish of the mind for it, or for a study of its possibilities. They can see nothing in this dairy business but, as one man expresses it, "being tied to the tail of a cow."

Such men can never hope to make money or find happiness in dairying. They ought to get out of it at once. They are square pins in round holes. The cows don't like them; the grass, the corn, the grain, the sunshine, all refuse to give them cordial, good returns, for the forces of nature everywhere do their best work only for their friends. When a man shows by his spirit, and speech, and action, that he is unfriendly to God and the work of His hands, then "the light fadeth from his eyes."

Some of these men write us sour, discontented letters. Everything is wrong; no wonder. They are wrong themselves. They have no love for their work. They do what they do from a reluctant sense of duty. They are unwilling soldiers in the ranks; drafted men probably.

We wish they could look at this grand work of dairying differently. We wish they could see the splendid possibilities of brain and heart and ambition, and happiness there is in it. Such a view of it would make grand men and dairymen of them. They have our heartfelt sympathy. We wish we could do something for them.

BRAINS IN THE HERDSMAN.

Mr. A. H. Shepard of Columbus, Mo., in his address before the Missouri Dairymen's Association, uttered the following keen, incisive truth:

I would rather take a scrub herd in the hands of a thoroughbred herdsman than a thoroughbred herd in the hands of a scrub herdsman. I have found that out by experience. I have seen very fine herds in the hands of bad herdsmen and the result was simply a loss; while I have seen common herds give good results in the hands of a good herdsman.

What is it that makes such a wide disparity between the cash returns of different patrons in every Creamery Patron investigation HOARD'S DAIRYMAN has taken? Was it the creamery? No. Was it the land or the sky or the weather? No. Was it the tariff? No. What was it? The man behind the cow. For the right man will have the right kind of cows; put them in right conditions, feed them, care for them and treat them rightly. What makes the man right? A disposition to be intelligent; that's all. How shall he become intelligent? By arousing his mind to take interest in the problems of his business; by not despising useful knowledge; by not thinking it is a fools business to handle cows; by reading the best thoughts of others and getting into his mind a true idea of what he is about. It will be easy enough for him to grow in knowledge, if he will but stand up where he can see the truth. It is the man that makes the business, just the same with cows as every where else.

MAKE A START.

There was a sense of strong appeal and an earnest desire for better work, that came to us in the remark of a neighbor the other day as he was talking to us of what he would like to do. "I would like to be a good dairyman, said he. "I would to like have such cows as you talk about. I know they are just the kind of cows I ought to have but between me as I now am and such cows, and such stables, and the kind of a dairyman I would like to be, is a pretty wide gulf." And then he asked if we thought there was any use of his trying to make a change.

This neighbor is like thousands of other good men who are farming with cows in a half hearted way, taking what they can get. The trouble to start with is that they are not more than half in earnest. They would like better cows and better surroundings and all those conditions that mark the prosperous, progressive dairyman. But they lack the hard patient, grit to make a start in the right direction and then hang to it. All these things will come sooner than they are expected if we but take hold of the job with determination. Most farmers think it costs too much to be a first-class dairyman. They are all the time holding up the penny of cost so close to their eyes that they can never see the dollar of profit that lies behind it. The only way is to make a start, and keep pushing. Resolve that another year shall not go by without over-hauling that dark, foul stable. Don't think that the money laid out in such improvments is thrown away. It will pay twice as big an interest as the money lent on a note of hand. A large portion of the stables in the North are made of stone, with not one window where there should be five. It will not cost much to cut out a lot of holes in those walls and put in plenty of windows. That will be one good start. Then ceil the top of the stable with matched flooring and make it tight all around so you can control the air currents, and put in the King system of ventila ion. Surprise the cows for once in their lives with an abundance of good, pure air in their winter home. If you cannot do any more this year, keep it in mind and work steadily to the purpose that as soon as you can your cows shall have a fair chance to make good profit for you. We would guarantee the final success of a great many men if we could only prevail on them to make a start. But like our neighbor, they keep looking at the wide gulf and never make an effort to cross it. It is not half as big it looks.

A Fond du Lac Cow Census and Its Lessons.

[Paper read by Mr. C. P. Goodrich at the Wisconsin Dairymen's Convention, Feb. 11, 1903.]

At the request of the President and Secretary of the Wisconsin Dairymen's Association, I came to Fond du Lac county last November to gather statistics from creamery and cheese factory patrons in relation to the dairy business, as it had been carried on here for the twelve months preceding October 1, 1902, with a view to presenting the results of my investigations to this meeting. I was well aware that here, as elsewhere, some men were carrying on the business at a good profit, and others at a loss, or, at best, getting very small pay for the work connected with it. I hope to be able to present the facts and figures, which I have gathered, in such a way—contrasting the methods of the most successful with those who have been less successful—as to enable those who have been working for nearly nothing, feeding and caring for cows, to do better in the future, by following the methods of those who have been making good profit.

THE SCOPE OF THE INQUIRY.

I visited 48 creamery patrons and 12 cheese factory patrons. I ascertained the average number of cows each had kept during the year, including the whole number, as well when they were dry as when giving milk, because they were eating all the time in either case, and counting heifers, after having their first calves, as full cows; the kind of cows and the kinds and amounts of the different feeds given the cows, and estimated the value of the same.

HOW COST OF FEED WAS OBTAINED.

I charged the cows for the feed raised on the farm the market price for which it could have been sold at the time, and for that which was purchased, the market price at the time it was fed. The prices I fixed on feeds are as follows: Timothy hay $12 a ton; other kinds of hay $8; corn stover $3 and ensilage $2.50. Pasture I fixed at the uniform price of $5 a head for the season. Oats were $28 a ton; corn, $21; bran averaged $19.50; gluten feed, $24; malt sprouts. $18.50; and oil meal, $30.

I assumed that each cow consumed of roughage during the winter two tons of hay, or its equivalent. In the case of corn stover I figured that, as a rule, only about half its weight was eaten, as the thick, hard stalks and some of the rest was refused by the cows or trodden under foot and wasted. Therefore, when all the roughage a cow had during the winter was corn stover I calculated it took four tons, or $12 worth. If half of her roughage was corn stover I charged her six dollars for it.

I had some difficulty in finding out the amount of grain feed each man fed. Some men, it is true, could tell me the exact amount of feed they had bought or had ground; then it was easy. Some could only tell by measure; then my experience in measuring and weighing feeds would enable me to estimate the amount in pounds. Some, who fed shock corn, could only tell the number of acres fed. In such cases I had to make an estimate from that.

I do not claim that I have got the cost of feed of cows in every herd exactly right. From the nature of the case that would be impossible, but I believe that I have approximated pretty closely to it.

QUANTITY AND VALUE OF PRODUCT.

After getting all these facts from the patrons, I obtained from the creamery and the cheese factory the amount of milk delivered by each patron, the amount of product and the amount of money received for each of these 12 months. From these data I was able to figure out the average per cow, of milk, of product and of money per cow, together with the prices obtained and the profit or lack of profit per cow in each patron's herd.

WHY PRICES FOR BUTTER DIFFER.

It will be observed that some patrons received a higher price per pound for butter than some other patrons did. This is owing to the fact that those who received the higher prices produced a larger portion of their milk during the winter months when the price of butter was the highest. The price of milk also varied, not only for this reason, but also on account of the difference in the percentage of fat it contained.

These facts and figures I have arranged in as convenient a form as I could devise, in the following table. The names of these patrons are not given. They are represented by numbers. I made a promise to that effect, when seeking the information, to each patron and also to the proprietors of the factories.

(See Table on Page 13.)

AVERAGES FROM THE CREAMERIES.

The 48 creamery patrons had 637 cows. By averaging the whole, we find the average cost of feed per cow to have been $29.88; average returns for butter from creamery, per cow, $35.82; average pounds of milk, per cow, 4204; average pounds of butter, 185; average net price of butter per pound to patron, 19.27 cents; average price of milk per 100 pounds, 85.2 cents; average value of butter for one dollar's worth of feed, $1.20; average net profit from butter per cow, over cost of feed, $4.94. Now, if we add 20 cents a hundred to the value of the milk as the value of the skim milk (and with the high price of all kinds of feed, last year, it was surely worth that) that would make $8.20 more, making an average profit per cow of $14.34. This is not so bad, after all, and shows there was a fairly good profit for the Fond du Lac dairyman even last year, when the high price of feed had cut down the yield and the profits below what they had been in previous years.

And still I have not counted all that the patrons received from their cows. There were the calves; the whole milk used in the family; the whole milk fed to calves; and the manure to keep up the fertility of the farm. These last items varied considerably on the different farms, but as it would have been impossible to arrive at anything like a just estimate of their value, I have left them out entirely. It is true that some patrons used more whole milk in their families, and fed more to calves than others, still it is not likely there would be more than two dollars difference per cow in extreme cases. Yet these last mentioned items, when all put together, would help to a considerable extent, to pay for the labor in caring for the cows.

I have selected a few numbers, some of the best and some of the poorest, and will now go into the particulars of what I learned concerning them, and see if we can discover the cause of the great difference.

ONE MAKES A PROFIT AND ANOTHER A LOSS.

No. 1—Had 14 cows, grade Guernseys and grade Jerseys, fresh in spring and winter; cost of feed was $42 per cow for the year; returns from creamery for butter per cow, $57.89; pounds of milk per cow, 5,488; pounds of butter per cow, 300; average price of butter per pound, 19 cents; average price of milk per 100 pounds, $1.05; value of butter for one dollar's worth feed, $1.38; value of butter per cow over cost of feed, $15 89. Average ration: bran, ground oats and corn, 13 pounds to fresh milkers, shredded corn stover, and for two months in spring

timothy hay; run to straw stack; in summer pasture only. Adding 20 cents per 100 lbs, for skim milk would make profits per cow $26.87.

No 2—21 cows, quarter blood Guernseys, fresh at all times; cost of feed, $31; returns from creamery, $29.26; pounds of milk, 3,361; pounds of butter, 155; price of butter, 18.9 cents; price of milk, 87 cents; for one dollar in feed, 97 cents; value of butter per cow, less than cost of feed, $1.74. Ration: bran and middlings 4 tons, which would make less than two pounds per day during winter; 4 acres, heavy crop, well-eared sweet corn, and timothy hay; in summer, pasture only. If value of skim milk is added his profits would be $4.98 per cow.

Now, we can see what made the difference in results between these two men? It is no doubt partly owing to the difference in the kind of cows—quarter-blood Guernseys may have been the product of a half-blood sire, or a cross of something with half-blood Guernsey dams—but mainly to the feed.

No. 1 fed a fairly well balanced ration. He fed high; believed in feeding well let it cost what it would, so he told me. His feed was very expensive yet he made a good profit.

No. 2 fed a very carbonaceous ration, did not believe in buying feed but in feeding what he could raise on the farm, whether it made a well balanced ration or not.

THE BANNER HERD.

No. 4—25 cows, grade Guernseys and grade Jerseys, fresh at all times; cost of feed, $28.00; returns from creamery, $57.18; pounds of milk, 5,809; pounds of butter, 298; price of butter, 19.2 cents; price of milk, 98.4 cents; for one dollar in feed, $2.04; net profit of butter over cost of feed, $29.18 per cow. Ration:—bran and malt sprouts, 6 pounds; well eared ensilage, 30 lbs.; straw; fodder corn in fall; in summer pasture only. Adding value of skim milk makes profit $40.80 per cow.

SAME KIND OF COWS BUT LESS PROFIT.

No. 7—12 cows, grade Guernseys and grade Jerseys, most of them fresh in October and November;cost of feed, $30.00: returns from creamery, $44.05; pounds of milk,4,201; pounds of butter, 220.3; price of butter, 20 cents; price of milk, $1.05 per 100 pounds; for one dollar in feed, 1.47; net profit of butter over cost of feed, $14.05. Adding value of skim milk makes profit $22.81. Ration: bran and some corn and oats, 4 lbs; ensilage, 35 pounds, a little oat hay; corn stover cut, wet, mixed and heated with ensilage; in summer pasture only, except a little in mangers to induce them to come in to be milked.

A BEEFY TYPE HERD.

No. 12—7 cows, grade Durhams of beefy type, fresh in winter and spring; cost of keeping, $29.00; returns from creamery, $27.95; pounds of milk, 3,266; pounds of butter, 152.2; price of butter, 18.4 cents; price of milk, 85.6 cents; for one dollar in feed, 96 cents; value of butter per cow less than cost of feed, $1.05. Adding value of skim milk makes a profit of $5.48 per cow. Ration: malt sprouts and ground oats, 6 pounds; corn stover, marsh hay and straw.

It is plain to see why No. 12 did not get as good returns as No's 4 and 7. He fed fairly well, though not as well as 4 and 7 did, for they fed ensilage; but apparently the main reason is, he was giving his feed to cows of a beefy type, while theirs were cows of good dairy type.

THREE GOOD HERDS, WELL MANAGED.

No. 20—5 cows, grade Jerseys, good dairy type, 3 fresh in March, 2 fresh in September. Cost of feed, $27 00; returns from creamery, $48.79; pounds of milk, 4,375; pounds of butter, 245; price of butter, 19 9 cents; price of milk, $1.11; for one dollar in feed, $1.80; net profit of butter over cost of feed, $21.79. Adding value of skim milk makes profit $30.54 per cow. Ration: 2 tons bran to the five cows; shredded corn stover and timothy hay, (¼ of roughage, hay); in summer pasture only.

No. 21—22 cows, Holstein and Holstein grades, 4 or 5 fresh in fall, balance in winter and spring; cost of keeping, $25; returns from creamery, $45.17; pounds of milk, 6,016; pounds of butter, 231.6; price of butter, 19.4 cents; price of milk, 75.1 cents; for one dollar in feed, $1.81; net profit of butter over cost of feed, $20.17. Adding value of skim milk makes profit $32.20. Ration:—1½ pounds bran, 45 pounds ensilage, 8 pounds clover hay, and oat straw, all they will eat.

No. 25—16 cows, Holstein thoroughbreds and very fine dairy type, most of them fresh in fall; cost of keeping, $40; returns from creamery, $67.79; pounds of milk, 8,396; pounds of butter, 333; price of butter, 20.3 cents; price of milk, 80.7 cents; for one dollar in feed, $1.69; net profit of butter over cost of feed, $27.79; adding value of skim milk makes profit $44.58. Ration:—8 pounds bran, 40 pounds of well eared ensilage, hay and corn stover, all they would eat; in summer good pasture only. Cows kept in good barn and fastened in Drown stalls.

COLD BARNS NOT CONDUCIVE TO PROFIT.

No. 26—17 cows, Short-horns and Short-horn grades, a few with a little Jersey and Holstein blood, fresh one-half in fall, rest in spring. Stable cold, cows fastened with chains; cost of keeping, $34.50; returns from creamery, $24.33; pounds of milk, 3,182; pounds of butter, 133; price of butter, 18.3 cents; price of milk, 76.5 cents; for one dollar in feed, 70 cents; value of butter per cow less than cost of feed, $10.17; counting the skim milk at 20 cents a 100 lbs.there is still a deficiency of $3.81. Ration:—bran, oats and corn ground, 8 pounds, marsh hay, a little timothy hay and fodder corn, not well eared. In summer, pasture and a little bran.

What is the matter with No. 26? In the first place, his cows are not very good dairy cows; and secondly, and the main cause of his failure to get better returns, is his barn was so cold and his cows so uncomfortable that a though half of them were fresh in the fall, they produced very little milk during the winter, as shown by the records of the creamery. He fed very well and quite expensively, but the cows had to use most of the feed to keep warm, and left but little for milk production. They gave most of their milk in summer on pasture, but even then they did not do very well, owing no doubt to the care they had in winter.

BETTER THAN THE AVERAGE.

No. 35—10 cows, grade Jerseys and grade Short-horns, fresh at all times, but most in early winter; cost of keeping, $36 50; returns from creamery, $44 91; pounds of milk, 5531; pounds of butter, 230.8; price of butter, 18.8 cents; price of milk, 81 cents; for one dollar in feed, $1.23; net profit of butter over cost of feed, $8.41. Adding value of skim milk makes profit $19 47. Amount of feed: 2 tons gluten feed, 3½ tons bran, 6 acres shock corn, well eared, timothy hay and corn stover; in summer pasture and 5 pounds bran to those giving a good mess of milk.

NEITHER GOOD COWS NOR GOOD MANAGEMENT.

No. 36—10 Grade Short-horns, fresh at all times;cost of feed, $30,00; returns from creamery, $28.57; pounds of milk, 3,626; pounds of butter, 152; price of butter, 18.7 cents; price of milk, 78.8 cents; for one dollar in feed, 95 cents; value of butter per cow less than cost of feed, $1.43; adding value of skim milk makes net profit, $5.82. Ration:—fodder corn with ears on, half the winter; then corn, oats and bran, 7 pounds; clover and timothy hay once a day, and corn stover once a day; in summer, pasture only. This herd are not first-class dairy cows. They were fed corn half the winter till they had nearly dried up, then they were fed bran and some clover hay, but it was too late to bring back the flow of milk.

No. 44—13 cows, grade Short-horns, part fresh in fall and balance in spring; cost of feed, $35; returns from creamery, $35 40; pounds of milk, 4,304; pounds of butter, 182; price of butter, 19.5 cents; price of milk, 82.2 cents; for one dollar in feed, $1.01; net profit in butter over cost of feed, 40 cents. Adding value of skim milk makes profit $9.00 per cow. Ration: well eared shock corn, 1½ months; then timothy hay and clover hay and 8 pounds ground oats and corn. In summer pasture, and in fall, fodder corn.

Here is another herd fed expensively and almost without profit. The mistakes here made are almost identical with the mistakes No. 36 made.

THE RELATION OF FEED TO PROFIT.

The 12 months through which these records run up make an unusually trying year for the dairyman. The widely extended drouth of the summer of 1901 had made all kinds of feed very high and when winter came some dairymen were puzzled what to do. Some decided to feed grain as usual, no matter what the cost. Others said, "I will not buy high priced feed to make a balanced ration, the cows will never pay for it." Those of this second class whose cows were fresh in the fall made a sorry mistake, as the notes which I have presented show.

There was still another class who had cows that would not freshen till spring. Some of them said: "We will give our cows cheap feed during winter—corn stover and straw—and not try to produce much milk in winter. They will be fresh in spring and give milk on pasture which is cheap. We may not get as much money per cow but we will make more real profit than you fellows who pay out all you get for milk for feed."

These arguments are quite plausible and we will see what these facts I have gathered show.

Let us take the three highest feeders. No. 1 fed $42.00, got back $57.89, made a profit of $15,89. No. 25 fed 40.00, got back $67.79, made a profit of $27.79. No. 28 fed $40.00, got back $45.39, made a profit of $5.39.

Now take the three cheapest feeders, and their cows were all fresh in spring. No. 13, fed $22, got back $29.78, made a profit of $7.78. No. 19 fed $22, got back $52.95, made a profit of $10.95.

No. 43 fed $20.00, got back $28.66, made a profit of $8.66.

Now, fellow dairymen, these are the facts: The cheap feeders did very well when their cows came in in the spring, and they made a pretty fair profit; but the good feeders did better. There may never again come a time when the cheap feeder with summer cows will have such an advantage. The winter of high priced feeds was followed by a summer of luxuriant pasture, such as has never before been seen in this country.

ENSILAGE A FACTOR IN PROFITABLE DAIRYING.

There are five creamery patrons who fed ensilage: No. 4 who made on butter $29.18 profit per cow, No. 7 who made on butter $14.05 profit per cow, No. 17 who made on butter $12.69 profit per cow, No. 21 with $20.17 profit per cow, and No. 25 with $27.79 profit per cow. One cheese factory patron fed ensilage, No. 4, whose profit on milk delivered was $22 23. These six silo men averaged $21.02 profit per cow, while the average profit of creamery patrons was only $5 94 per cow. The gross returns for the silo men averaged $52.52 per cow, while those who did not feed ensilage received an average of but $34.00 per cow,a difference of $18.52 in favor of the ensilage men.

Can any one doubt, in face of these facts, that it will pay to build a silo? Is it possible that all this gain in gross receipts and profits is because these men feed ensilage? Or, is it, in part, because these men are more progressive, up-to-date farmers, have better dairy cows, study to feed a balanced ration, and, in short, have less of old fogyism than many of those who do not have silos? These are questions for you to ponder on and answer.

My own opinion is that, although I think any man is making a great mistake who keeps a herd of dairy cows without having a silo, the feeding of ensilage did not and could not, of itself, make this astonishing difference of over 54 per cent in gross receipts and more than 500 per cent in net profit.

Prof. Voorhees, Director of the New Jersey Experiment Station, found that ensilage increased the amount of milk 12 per cent over dry feed of the same kind, when everything else was equal. Taking that statement as being the real difference in favor of ensilage, then in our case $4 08 out of the $18.52 gain per cow should be credited to ensilage and $14 44 to "the man behind the cow."

So I hope that none of you here who have had small returns per cow will entertain the idea that all you have to do, to get as large returns as these men who fed ensilage, is to build a silo. A silo will no doubt help some but something else is needed.

RELATIVE PROFITS OF BUTTER AND CHEESE.

I took the statements of 12 patrons of a cheese factory. This factory made cheese the year round, and paid for milk by test and these 12 were nearly all that had patronized the factory the whole 12 months.

These patrons had 172 cows. The average cost of feed per cow was $29.60; average returns from factory for milk, $34.20; average pounds of milk per cow, 3,835; average price of milk, 88.2 cents per 100 pounds; average profit per cow, $4.40.

There are many persons who wish to know whether it is more profitable to patronize a creamery or a cheese factory. It will be seen that the average price of milk at the creamery was 85.2 cents per 100 pounds, while at the cheese factory it was 3 cents more. This statement is a little misleading, for the milk received at the cheese factory did not average so high in test as that received at the creamery. Four per cent milk at the creamery averaged 84 cents and at the cheese factory 92 cents. Possibly this 8 cents may make up for the difference in value between skim milk and whey. At all events you have the facts as I found them.

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condense the questions into plain specific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

A Nova Scotia Ration.

F. A. K., N. S. writes:

I have plenty of good hay and oats, no roots. Oats are worth 45 cents per bushel, costs 3 cents to grind them. Can buy good bran for $1.15 a hundred weight; middlings $1.40; corn, $1.60; cotton seed meal, $1.75; cows weigh about 1000 pounds, freshened November 1st. At present am feeding 5 quarts of bran and ground oats and one pint cotton seed meal daily.

Very much will depend upon the character of the good hay, whether it is timothy or clover, or from mixed grasses. Something also will depend upon whether a hundred weight in Nova Scotia is 112 pounds, as in England, or 100 lbs. as in the United States; but in either event we should consider bran much cheaper than oats and should be disposed to feed a combination of bran and corn and hay. Mix the bran and ground corn in equal parts by weight and feed from 6 to 10 lbs. per day, adding, if it appear to be necessary, as he is doing at the present time, about 1 lb. of cotton seed meal to the daily allowance.

A Pennsylvania Feeding Query.

My cows are mostly grade Holsteins, fresh, milk goes to creamery, which pays for the butter fat. Have corn ensilage, corn fodder and ear corn. Must buy all other feeds. Will you kindly give me a ration to suit the case.

Carversville, Pa. SUBSCRIBER.

It will be a veritable leap in the dark to attempt to construct a ration formula without knowing more definitely what feeds are available to our inquirer. Corn silage, corn fodder and ear corn are all low in protein, and of course they require some highly nitrogeneous feed to go with them in order to make up a suitably balanced ration. Bran, the different glutens, brewers grains and distillers grains, cotton seed meal, linseed oil meal, buckwheat middlings, malt sprouts are among the different feeds that could be brought into requisition. If this inquirer will write us again stating what feeds are available in his local market we shall be glad to give him more specific sugeestions.

Green Manure for Worn out Land.

I have a number of acres of very good land that is partly run out, have no manure that I wish to put out to it as it is quite a distance from buildings. Can I sow on a crop of crimson clover and plow under for fertilizer and keep it in as good shape as it is now?

How much do they usually sow to the acre, and is it a good time to sow in spring and plow under in the fall? L. H. C.

Vt.

It is probable all things considered, that a crop of rye will be a surer method of supplying fertility to the above land than crimson clover. Humus is what is wanted for such a soil and this turned under rye will supply quicker than the clover. Moreover clover although it gathers nitrogen from the air, requires a fair amount of nitrogen in the soil to give it a good start and this a worn out soil does not contain. It is also to be considered that rye will give a good growth for turning under in a few weeks, whereas clover requires several months to give the same amount of humus producing material. Although rye is more properly sown in the fall, yet an early spring sowing will give good results when the crop is to be plowed under.

Per Cent Fat in Cream.

1. What will cream test when 90 lbs. produce 38½ lbs. butter?

2. Will cream always test the same from same cows and separated with the same hand separator? S. H.

Markham, Ont.

1. At the above rate the cream should contain about 35.7 per cent of fat, estimating the over run at 1-5. Of course the above is only approximate, as the fat in the butter milk,and the actual over-run are not known.

2. Cream from the same cows and the same separator will vary several per cent according to the conditions of separation.

Malt Sprouts.

An Ohio reader asks us to give him the relative feeding value of malt sprouts and bran. As recently as October 31st last, on page 796, we gave a full table of the digestible nutrients in all the more common American feeding stuffs. If this paper had been preserved a reference to it would have shown that malt sprouts contain about 50 per cent more digestible protein than bran, a trifle less carbohydrates and only about half as much fat. It would seem to follow, therefore, that malt sprouts, if of prime quality, are somewhat more valuable than bran, but unfortunately, unless these sprouts are properly dried and cared for, they sometimes are not of prime quality. Probably a combination of sprouts and bran, or sprouts and ground corn, would be better than to depend exclusively upon the sprouts.

Hard Milking Cows.

Mr. D. L. H., Newaygo, Mich., writes that he has a nice young cow, a good butter maker and the only possible fault about her is that it is very difficult to draw her milk.

This difficulty can sometimes be overcome in a measure by the use of a dilating plug, but in extreme cases it is recommended to cut the sphincter muscle at the extremity of the teat with an implement especially made for that purpose, or with a very sharp, small-bladed knife. An old fashioned gun maker in New York used to make a special implement for this purpose out of a three cornered file, by hollowing out the sides and bringing the corners to a sharp razor edge and inserting the point as far as necessary to sever the muscle. Veterinarians use a bistoury for the same purpose. This is an instrument with a dilating blade working in a groove or slot that can be made to project more or less when the instrument is removed and thus do the cutting.

We do not think milk tubes are of any particular avail in cases of this character.

Abnormal Shrinkage in Milk.

A Missouri inquirer writes that he has some Holstein cows and heifers that shrank nearly 50 per cent in October and although generously fed and kept in a warm stable, with good spring water in front of them all the time, he has been unable to recover this loss. He is feeding 4 lbs. of brewers dried grains, 3 lbs. of bran, 1 lb. of cotton seed meal, 3 lbs. of corn meal, and corn stover, kaffir corn fodder and Kansas hay *ad libitum*, with salt every night and morning.

There does not seem to be anything the matter with the style of feeding nor anything with the care the animals receive. The indications are that there was something in the feed last fall that caused this shrinkage, but what it was, of course we are unable to state and we do not know whether there is any change in feed that will accomplish anything during the present period of lactation. These things happen once in a while. The causes of them are too hidden for discovery. We are not doctors and therefore we do not feel called upon to hazard guesses. If in addition to shrinkage in milk these cows are laying on body fat, we should reduce the feed quite materially, first by omitting the corn meal. Possibly a thorough cleaning out of the digestive tract, and good, thorough brushing and carding of the cows every day, to start proper secretions from the skin, would help matters.

Sorghum Hay.

An Indiana reader reports that he has thought of breaking up his meadow next summer, after cutting the hay, and sowing sorghum broadcast, to be cut late in the fall with his wheat binder and use the same as roughage for his cattle, and asks whether this would make good feed and whether we would advise such an undertaking.

Sorghum hay cut in this manner has proved a very acceptable roughage for milch cows and other cattle in some of the western states, but whether it would be advisable for our inquirer to plow up his meadow, etc., introduces an entirely new element into the problem and that is a question he must answer for himself.

Two Wisconsin Questions.

J. S., Kennan, Wis., submits the following questions for answer:

1. Why do not advertisers in the DAIRYMAN offering stock for sale give the prices they hold their stock at? It would save correspondence to a prospective buyer, as is the case with me.

Advertisers frequently do this when they have only one or two animals for sale, but most of them have a number of animals for sale and it would require too much space to specifty prices in detail. In fact, it would require a full catalogue to give descriptions and prices of all the animals in the herd. The object of advertising is to bring the advertiser and the purchaser into correspondence. The purchaser states in general terms what he wants and the advertiser answers accordingly.

2. What is the usual service fee in the southern part of the state for registered animals?

This will vary greatly in different localities and under differing circumstances. Frequently for grades, the fee, if the product is a heifer, is $5, otherwise, merely nominal. Sometimes it is $5 without regard to sex of the progeny, and sometimes when registered animals are brought for service, the fee is much larger.

Siloing Dry Corn.

Mr. C. E., of Greensburg, Ind., asks whether a person could fill a silo with dry corn and fodder, and by wetting it add any to its feeding value or would it spoil the feed.

Dry corn, meaning by this expression the stalk and ear as it comes from the field, has been very successfully siloed, but this adds nothing to its feeding value, except making the coarse stalks somewhat more palatable. However, we would in no case advise attempting to silo the entire dry plant, but would certainly break off the ears before putting the forage into the silo.

Holding up Milk.

Mr. H. H. W., Galesburg, Mich., reports the case of a large Durham cow which freshened recently. When two days old he took the calf away and up to date of writing the cow has seemed to refuse to give down milk, except in very limited amounts from one quarter. He

"ADVERTISEMENT."

I WILL CURE YOU OF RHEUMATISM

Else No Money Is Wanted.

Any honest person who suffers from Rheumatism is welcome to this offer.

I am a specialist in Rheumatism, and have treated more cases than any other physician, I think. For 16 years I made 2000 experiments with different drugs, testing all known remedies while searching the world for something better. Nine years ago I found a costly chemical in Germany which, with my previous discoveries, gives me a certain cure.

I don't mean that it can turn bony joints into flesh again; but it can cure the disease at any stage, completely and forever. I have done it fully 100,000 times.

I know this so well that I will furnish my remedy on trial. Simply write me a postal for my book on Rheumatism, and I will mail you an order on your druggist for six bottles Dr. Shoop's Rheumatic Cure. Take it for a month at my risk. If it succeeds, the cost is only $5.50. If it fails, I will pay the druggist myself—and your mere word shall decide it.

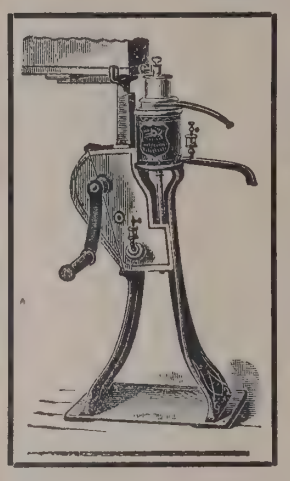
I mean that exactly. If you say the results are not what I claim, I don't expect a penny from you.

I have no samples. Any mere sample that can affect chronic Rheumatism must be drugged to the verge of danger. I use no such drugs, and it is folly to take them. You must get the disease out of the blood.

My remedy does that even in the most difficult, obstinate cases. It has cured the oldest cases that I ever met. And in all my experience—in all my 2000 tests—I never found another remedy that would cure one chronic case in ten.

Write me and I will send you the order. Try my remedy for a month, as it can't harm you any way. If it fails it is free.

Address Dr. Shoop, Box 934, Racine, Wis.



Mild cases, not chronic, are often cured by one or two bottles. At all druggists.

STAR MILK COOLER CO., Haddonfield, N. J.

EASY. It is easy to go on losing money by taking care of milk in the old way, that is, by not taking care of it: But it is easy, too, to take proper care of your milk with a

Champion Milk Cooler-Aerator

The Champion is pre-eminently the easy Cooler—easy to buy, easy to take care of, easy to use.

A Booklet for the asking.

Champion Milk Cooler Co.

67 Main Street, CORTLAND, N. Y.

is not certain whether this is a case of holding up milk or whether there is some obstruction.

Neither are we. It sometimes happens that a film forms, between the lower milk cistern in the udder and the channel in the teat, which prevents the milk from coming down. In such cases it has been advised to puncture this film. If nothing better offers, use a good sized knitting needle. Of course a bistoury, if long enough to reach the trouble, would be better.

We do not wish to be understood as saying that the trouble reported is due to the cause suggested, but if it is not, we do not know what it can be, and if any attempt is made to explore the teat or udder, it should be done very cautiously with thoroughly sterilized instruments well greased.

The question about lice has been fully answered in the veterinary columns.

To Sell Milk or Make Butter.

Mr. S. W., of Ind., asks which would be the better, to make butter at 20 cents per pound, or sell milk at 20 cents per gallon delivered to customers in a near-by city. It will require the services of two men and three horses to deliver the milk.

It would seem that Mr. W. himself, with all the facts before him, is better qualified to answer this question than we can possibly be. We know nothing as to the quality of the milk, how many pounds of butter a hundred pounds of it will make. We know nothing as to the wages he must pay or anything of that kind. It is a very simple matter for him to find out just how much butter he can make and just how much it costs him now to deliver his milk, and when he has these facts before him it is easy to tell which is the more profitable. There is one item in the problem that should not be overlooked, and that is the value of the skim milk. A hundred pounds of skim milk is easily worth half as much as a bushel of corn, and under certain conditions and for certain purposes a good deal more than this.

A New York Feeding Problem.

I wish to tell you how I am feeding my cows fresh in milk and see if you can better it in any way for profit. I feed them corn stover noons, all the buckwheat straw they will eat nights, clover hay mornings and the following grain rations at two feeds: 2½ pounds of bran, cost 2½c; 4 lbs. buckwheat middlings, 4 cents; 1½ pounds oil meal and cotton seed meal, equal amounts, 2½ cts; 4 pounds corn meal at noon, 3cts. Total, 14 cts. for grain. Cows are making from 7 to 9 pounds of butter each in 7 days. The corn meal is a late experiment, am well pleased with it. Would you feed more bran and less buckwheat middlings? Will commence feeding ensilage again April 1st; will have no pasture. W. F. S.
Silver Creek, N. Y.

Cows that make from 7 to 9 lbs. of butter in seven days, are doing very well indeed, and it is perhaps doubtful whether any considerable change in the manner of feeding would prove profitable. It seems to us that previous to the addition of corn to the grain allowance, the cows were not receiving the requisite amount of carbohydrates, but an over supply of protein. We see no reason why the cotton seed meal and the oil meal as now fed, may not be dropped from the ration and enough remain to enable these cows to do their very best. Drop out the cotton seed meal at first, little by little from day to day, and if this does not make a decided decrease in milk, do the same with the oil meal. We do not think that buckwheat straw is of any particular feeding value. At all events, we can not find it quoted anywhere in the analyses of feeding stuffs.

Feeding for Milk in New York.

Mr. T. G., Salem, N. Y., writes that he is furnishing milk to customers and wants both quantity and quality. He has two silos filled with good corn fodder, one with the ears broken off and the other with them on. Corn is 75 cents per bushel; bran, $22 per ton; middlings, $24; gluten feed, $23.

The price quoted for gluten feed is relatively very low and casts at least a shadow of suspicion upon its quality. Examine it pretty closely and if it is all right we would suggest feeding equal parts of bran and gluten, an average of 8 lbs. per day, with all the silage the cows will eat. It is very desirable at all times to have some dry fodder to go with the silage. Just why, cannot be satisfactorily explained, but the best dairymen have found that a little hay, even with the best of pasture in summer, is greatly relished by the cows, and whatever is relished by them it is desirable to furnish, at least in moderate amounts.

A Minnesota Feeding Inquiry.

E. H. B., Dundas, Minn., has plenty of good second crop clover and timothy hay and lots of corn stalks. At present he is feeding unground oats and corn, and asks if we think it would pay to buy bran at $14 a ton when oats are worth 30 cents and corn 39 cents.

We think it would very surely pay to exchange the oats for bran, and, unless too expensive, we certainly would have the corn ground. Mix the ground corn, or corn and cob meal, with bran, equal parts by weight, and feed from 6 to 10 lbs. according as the cows are able to respond in milk.

An Albama Feeding Inquiry

Mr. L. R., Citronelle, Ala., a recent settler there from Illinois, appears to be well pleased with his change of location. He has cow pea and Japan clover hay mixed; also some velvet bean hay and plenty of corn stover. Cotton seed meal is worth $25 a ton; bran, $21; shorts, $24. He says nothing about corn, but having mentioned corn stover the presumption is that he also should have more or less corn on hand, and if this is the case we should be disposed to recommend him to feed as an average allowance for his milch cows about 4 lbs. of bran, 4 lbs. corn and corn cob meal with, say, 10 lbs. of stover and 10 lbs. hay. His hay is of such quality and furnishes such an amount of protein that we would not consider it necessary to feed very much cotton seed meal, if any at all. Cotton seed meal is very high in protein but very low in carbohydrates. If corn is not available, then, of course, there must be some cotton seed meal fed.

His question what to do for calves that have been afflicted with ticks has been referred to the Veterinary Editor for consideration.

KNOWS NO DISTINCTION.

Rich and Poor Alike Suffer From Catarrh in This Climate.

All observant physicians have noticed the enormous increase in catarrhal diseases in recent years, and the most liberal and enlightened have cheerfully given their approval to the new internal remedy, Stuart's Catarrh Tablets, as the most successful and by far the safest remedy for catarrh yet produced.

One well-known catarrh specialist, as soon as he had made a thorough test of this preparation, discarded inhalers, washes and sprays and now depends entirely upon Stuart's Catarrh Tablets in treating catarrh, whether in the head, throat or stomach.

Dr. Risdell says, "In patients who had lost the sense of smell entirely and even where the hearing has begun to be affected from catarrh, I have had fine results after only a few weeks' use of Stuart's Catarrh Tablets. I can only explain their action on the theory that the cleansing and antiseptic properties of the tablets destroy the catarrhal germs wherever found because I have found the tablets equally valuable in catarrh of the throat and stomach as in nasal catarrh."

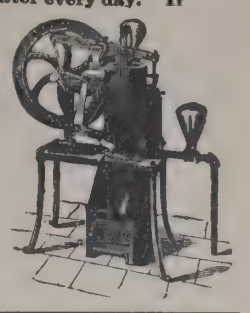
Dr. Estabrook says, "Stuart's Catarrh Tablets are especially useful in nasal catarrh and catarrh of the throat, clearing the membranes of mucus and speedily overcoming the hawking, caughing and expectorating."

Any sufferer from catarrh will find Stuart's Catarrh Tablets will give immediate relief and being in tablet form and pleasant to the taste, are convenient and always ready for use as they can be carried in the pocket and used at any time as they contain no poisonous drugs, but only the cleansing, antiseptic properties of Eucalyptus bark, blood root and Hydrastin.

All druggists sell the tablets at 50 cents for complete treatment.

HALF ENOUGH WATER

Is quite enough for some people, but most people want water every day. If



RIDER or ERICSSON HOT AIR PUMPS

Are used you can have water every day in the year, and your cook or stable boy is the only engineer needed. 25,000 in daily use. Catalogue "B 5" on application to nearest store.

BUHL CANS ARE NOT Like Other Milk Cans Because They Are Better

This is equally true of the Buhl Factory, "Improved Elgin" and Genuine Iowa Cans; superior material, design, workmanship, and smooth finish combine to produce those **long wear** qualities for which the **Buhl Cans** are so renowned. **Remember** the Buhl is the only can in the world that is made with the BUHL "VICTOR" CAN BREAST and the BUHL "VICTOR" ROUND HANDLE. They may cost a little more than common cans—we do not know, for we cannot tell how badly "the trust" and others are beating you. We know that the small added cost of the **Buhl Cans** will prove the best can investment you ever made. Every can that is stamped with our famous Milk Can Trade Mark, as shown here is a genuine **Buhl Can.** The mark is a guarantee of all around excellence. Ask your local dealer for **Buhl Cans.** If he does not have them he can get them for you. Write us about it. We will see that you are supplied.

Buhl Stamping Company, 212 W. Larned Street, Detroit, Mich.

The Distribution of Skim Milk.....

It is known that the just complaints of creamery patrons on account of unfair distribution of skim milk are the bane of the separator creamery business. Further disputes among patrons, annoyances to managers, hindrances to the best work of buttermakers, watering the skim milk, and many other ills in the same train are unnecessary, since the

Barber-Coleman Check Pump

has for more than five years been successfully solving the problem in many different creameries. When a patron has dropped in his check he can pump the amount of skim milk called for by his check, less the percentage taken out as cream, so in like proportion to all other checks. Its measuring apparatus is just an ordinary pump which everyone understands and knows how to operate.

A Cow Census Begets Improvement.

Report from a Wisconsin Dairyman.

ED. HOARD'S DAIRYMAN:—It may be remembered that one year ago I presented to the meeting of the Wisconsin Dairymen's Association, held at Menomonie, some facts and figures which I had obtained in taking a "cow census" of the patrons of the Rusk creamery. These were summarized in tabular form, and copies of the table were distributed through the audience. No names were given, but numbers instead.

After the session at which this matter had been presented, a young man came to me and said: "What is my number?"

I replied: "Don't you know your number?"

"No. I have studied this list over and can't make it out."

"Are you sure that you want to know your number? I am afraid you will not feel as well when you know as you do now."

"Well, I want to know."

"Yours is 'No. 4'."

The look of amazement that overspread his face at that was interesting to see. "No. 4" was the one who did not get enough for butter to pay for the feed his cows ate. He knew the figures as to number of cows and value of feed were correct, for he had helped me make them out, and the money returns I had got from the creamery. After looking at the table a short time he exclaimed with great vehemence: "For heavens sake, is that the kind of work I have been doing! If I cannot do better than that I shall have to quit."

Then after a pause he said: "*I will do better.* I hope you will come up here next year. and investigate and see if I don't."

I have not been there, but I am highly gratified to receive the following letter from him.

"——, Feb. 5, 1903.

MR. C. P. GOODRICH, FT. ATKINSON, WIS., DEAR SIR:—You remember No. 4, on your cow census of Rusk Creamery patrons of Dunn county.

Thinking you would be pleased to know of improvement I have made along that line, I herewith send statement of the year 1902:

Money received from creamery	$1,170.96
Used at home by two families	70.00
Skim milk (20 cents per cwt.)	250 00
21 calves	105.00
Total	$1,595 96
Cost of keeping 21 cows	630.00
	965.96
Net gain per cow	$46.00

This is much better than the preceding year, but I see where I can make it better still in future. Very truly yours,

—— —— ('No. 4')"

The cost of keeping was $30 per cow, each year, but the returns for butter from the creamery were for 1902, $55.76 per cow, instead of $29.53 the year before.

This shows what can be done when there is a determination to improve, and where one is willing and anxious to adopt better methods.

I predict a successful future for "No. 4," for it will be seen he now does some figuring and keeps accurate account of what he is doing. If this cow census work will have this effect on even a few men, the work will not have been done in vain. "No. 4" the past year kept but 21 cows, while the year before he had 25. Of course he has been testing his cows and rejecting some of the most unprofitable ones. C. P. GOODRICH.

Ft. Atkinson, Wis.

CONCERNING OUR ADVERTISERS.

The Oakenwald Stock Farm of Genesee, Wis., have for sale a 6-year-old bull of very fine breeding that has been at the head of their herd. The bull must be sold to avoid inbreeding. See advertisement among Jersey ads.

MARCH ON!

The artistic hanging calendar of the Champion Harvesters begins with the spring month and carries one clear through to the next spring. It shows a handsome farm team refreshing themselves at the watering trough, and is in brilliant colors and handsome enough to please everyone. This art calendar is offered free to all of our readers who will send their name on a postal to Champion Division, International Harvester Co., of America, Chicago, and make request for same. We know this is an opportunity of which many will take advantage.

IN 1845 AND NOW.

The inside front cover of the Deering "Golden Era" catalogue for 1903 contains a story without words. A section of the Chicago river as it was in 1845 is pictured. It shows an Indian wigwam, Indians in canoes and upon the banks of the river there are no signs of civilization.

On the same page is shown the river at the same

——GASOLINE ENGINES——

as power for the dairy have passed the experimental stage. Many dairymen now have them and all eventually must have them. The only questions to decide are the amount of power needed, and the most desirable make. With twenty-seven years of experience behind us, and a plant that has grown from 50 engines a year to 1500 a year capacity, we feel that we are equipped to build the best. There are other reasons why the **"OTTO"** is superior. We will tell them in this space from time to time. If in the meantime you need power, write us, mentioning this paper.

MARLIN

THE MARLIN RIFLE, Model 1892, .32 calibre, is the best rifle made for the farmer, combining the good points of the old muzzle-loading squirrel rifle with the convenience and rapid fire of the most improved repeater. It is so constructed that the same rifle uses the following cartridges: .32 short and long rim fire, .32 short and long center fire, and is the only repeater made using rim fire cartridges larger than the .22 calibre. The short cartridges are just the thing for small game while the long ones kill hogs and beef handily. On the first 2000 cartridges used you have saved the cost of a Marlin.

The Marlin Hand Book for shooters explains why this is so and tells how to care for, and how to use, fire arms. This valuable book free if you will send stamps for postage to THE MARLIN FIREARMS CO., NEW HAVEN, CT.

point, as it is to-day, full of ships and lined with docks. The banks contain the great Deering works, 85 acres of buildings and a veritable hive of industry. A marvelous change and one that has taken place in less than fifty years.

Cotton Seed Meal not Injurious.

ED. HOARD'S DAIRYMAN:—I notice in the last number an article from J. R. O'Gorman, Mobile, Ala., giving his experience with cotton seed meal. I think his must be very delicate cows to give him so much trouble, or perhaps the cause of their getting poor, was because he did not feed enough. I am feeding my cows one quart of cotton seed meal twice a day, (this is 3 lbs. per day, Ed.), and have fed the same amount to the same cows for the last three years and my cows are in fine condition and giving plenty of good, rich milk. I feed the same amount of wheat bran that I do meal, and for the rest, prairie grass and hay. In three years, I have only lost one calf and that was nearly a year old and running out to good pasture. G. T. L.

Brunner, Texas.

DAIRY MARKETS.

ELGIN, Ill., Feb. 9—Butter—Remains firm at 25c. There were no offerings and no sales, the quotation committee fixing the price. The sales of the week aggregated 506,000 lbs.

CHICAGO, Ill., Feb. 9—Butter—Quiet; steady; creameries, 16@25c; dairies, 15@23c.

Eggs—weak; firsts, cases included (60 per cent new laid), 19c.

Cheese—Steady; Twins, 13c; Daisies, 13¼@14c; Young Americas, 13½c.

Cattle—Good beeves, 1,300 to 1,500 lbs., 5.80@6.20; good to choice beeves, 5.20@5 75; fair to good export and shipping steers, 4.75@5.15; medium beef steers, 4.10@4.50; plain and roughish steers, 3.80@4.15; common and rough, 1,000 to 1,250 lbs., 3.00@3.65; good to fancy heifers, 4.20@4.75; good to choice feeders, 3.40@4.50; poor to plain stockers and feeders, 2 25@3.80; bulls, plain to fancy, 2.25@4.50; good to fair cows and heifers, 3.30@4.25; good cutting and fair beef steers, 2.65@3.60; common to good canning cows, 1.60@2.60; veal calves, good to fancy, 5.75@7.75; veals, coarse and common, 3.00@5.50; corn fed Western steers, 3.50@5 85; Texas bulls and grass steers, 2.75@3.20. Texas steers, fair to choice, 3.40@4.60.

Hogs—At the outset to-day arrivals were estimated at 48,000 head. Three hours later the run was cut down to 40.000 head. Good to prime heavy shipping, 6.90@7.10; good to choice heavy packing, 6.70@6.90; plain to choice heavy mixed, 6.75@6.90; selected butcher weights, 6.80@7.00; assorted light, 150 to 195 lbs., 6.50@6.80; common to light mixed, 6.35@6.70; thin to choice, 50 to 125 lbs., 5.50@6.35; stags and rough lots, 3.15@6.20.

MILWAUKEE, Wis., Feb. 9—Butter—Creamery—extras, 25c; extra June, (storage), 23c; firsts, 22c; seconds, 17c; process (renovated), 20½@21c. Dairy, fancy, 17c; lines, fresh, 14@15c; roll, 14@15c; packing, 13c; whey, 10c; grease, 5@6c.

Cheese—American full cream, Twins, 12½@13c; Ycung Americas, 13@13½c: Daisies, 12½@13c; Longhorns, 13½@14c; low grades, 10@12c. Brick, fancy, 12½@13c; low grades. 10@11c. Limburger, fancy, 11½@12c; low grades, 10@11c. Swiss, drum, choice, 12½@13c; drum, No. 2, 10@11c; Block, choice, 12@12½c; Block No. 2, 10@16½c.

Eggs—Strictly fresh-laid, loss-off, cases returned, 21c; seconds, 14c; storage city, No. 1 April stock, 18c. Country, 16@17c. Market easy on fresh and storage; demand fair and movement slack; storage stock is offered freely; demand is only fair and stock is not moving as well as might be desired. Receipts, 220 cases; Saturday, 210 cases.

BOSTON, Mass., Feb. 9—Butter—Creamery, Western extra, 25½@26c; firsts, 25c; dairy, 15@24c; imitation creamery, 18@21c; ladle, 18@19c: box and print, 20@26c.

Cheese—Choice, 14c; sage, 14@14½c; fair to good, 10@12c.

Eggs—Near by, 26c; Western selected, 21c; fair to good, 17@20c; Illinois, 21@22c; refrigerator, 14@17c.

The only through sleeping car line between Chicago and "The Soo." For tickets and full information apply to agents Chicago & North-Western R'y. 1-3

TWO FARM SEPARATOR FACTS

FOR BOTH

Creameryman and Patrons.

In every instance where experienced creamerymen, having a knowledge of separators and appreciating the necessity of a common interest between creamery and patrons, are putting in "Farm" separators on a considerable scale. - - - - - - - -

THOSE SEPARATORS ARE THE DE LAVAL.

In every instance where the sale of ANY OTHER MAKE OF "FARM" SEPARATORS is being attempted on a considerable scale, the parties are new beginners in creamery work or else mere promoters or what the conservative creamerymen term "pirates" in the business, in either case without knowledge of separators or the character of relationship between creamerymen and patron essential to the enduring prosperity of both.

The comparison speaks for itself—it is in keeping with the difference between the De Laval and inferior makes of separators.

For Sale—Entire herd of grade Jersey cows and heifers. One bull registered in A. J. C. C. Call and see them. VAN DUYN BROS., Zenobia, Ill. 50-7

Do You Want—A Hay Fork Returner? Every farmer having a barn should have one. A hummer for agents. Circulars free. ROONEY RETURNER CO., Box D., Independence, Iowa. 50-tf

Wanted—Experienced cheese maker of good character and ability; small family. Must guarantee work. Address L. R. CHEESE CO., Camp Douglass, Wis. 52-2

Nothing Equal to the Cow to Redeem Worn Land.

ED HOARD'S DAIRYMAN:—As I do not know when my subscription to the HOARD'S DAIRYMAN expires, and as I do not want to miss getting every copy published, I take this opportunity to remit for it. So please find enclosed draft for $1.25 for which send me the paper for another year; for the 25c you may send me Woll's Book on Silage.

We have just completed a new creamery here in the last six months, and there is not a silo in this country for many miles around, and few people know what a silo is, or what it is used for. You may know the reason, when I tell you that this is the center of the broom-corn and Indian-corn district, which has had the reputation of growing the best crops of the same. Our people have been growing the above crops a long lifetime, and hauling the fertility of our farms to the railroads, and usually selling the crop at a very small profit, considering what they sold with them. The result is, our farms have decreased in those elements of fertility that usually make a good crop for an ordinary season.

To bring our farms up to a better standard of producing good crops, we of necessity must put some kind of stock on them that will help to restore the fertility that we have lost in the past, and we can think of no better way than to bring back to the farm, the mother of our last chance, (the good old milk cow), turn our corn acreage to grass acreage, sow more clover, more grasses of all kinds that is possible for us to raise. We will have to build silos; and as we have the corn crops to fill them with, and while I myself do not claim to know much about silage, I am as willing to learn as any one for the benefit of knowing, as well as making myself able to tell those people who do not care to take the pains to read for themselves. We have many people who are willing to learn by listening, and by taking notes from observation, or copy from these who venture out for success, but do not want to waste any time on an old newspaper. We all learn from one another, of course, but those that read, I find learn much faster than those who do not, and are the first usually to venture after new ideas.

Our fathers have worn out the soil, raising their boys up for presidents, store clerks, office boys and agents of all discriptions but a small number ever had the pleasure, of an agricultural education, that would make them able to recover the long lost fertility of the farm that has been exhausted in bringing them up to manhood. Thus they leave the farm to take care of itself in the end, while they go to the city. Our farms are in need of men who read when they rest, and think while they work, and dream while they sleep, to bring them back where they ought to be, for there is something more to do than to plow, plow, plow, and husk corn for market, if we would make the improvement of the farm compare to the appearance of the nearby city or town.

There is a popular chromo of a well improved town or city placed in front, with a ragged farm as a background, as a pleasing picture to look on. I remember seeing pictures of the old homestead, with the old fashioned fences and surroundings, that seemed pleasing to look at, and perhaps in their time was a happy abiding place, but in these times of improvements and better things at our command, to help us to better things and conditions, I believe that the picture of the old homestead, which is a mark or monument of the abiding place of the past, can not be used as the material and model for building the happy abiding place of the present. CHAS. H. FARIS

Lerna, Ill.

Farm Ideas About Dairy Foods. Soiling Crops.

Every farmer ought to have a true, intelligent idea about the value of the various foods he raises. He can have such ideas if he will read and make himself intelligent. Prof. Voorhees of the New Jersey Experiment Station, is one of the hardest students in the land on this feeding. He don't profess he knows it all, but he knows a lot that thousands of farmers could mighty well afford to swap their ignorance for and pay big boot. The farmer raises these foods at large expense, but because he does not know their feeding value oftimes, he wastes them, and beats himself. Here are some ideas Prof. Voorhees brought out in a recent address:

A ton of one kind of forage is worth much more than a ton of another kind.

Compare the dry matter of a ton of corn fodder with a ton of millet or teosinte. Twenty tons of the latter does not contain as much dry matter as two tons of corn fit for feeding. Again, there is a difference in the value of the dry matter. A ton of clover is worth much more than a ton of corn.

The first soiling crop at the New Jersey Station is rye. Almost invariably, it is not cut soon enough. Cut it just as soon as it begins to head out. The second soiling crop is wheat. Wheat and rye, if cut *early* are nearly as rich in protein as clover, but they rapidly decrease in value. Concerning alfalfa, he says:

One of the most valuable forage crops is alfalfa. It is difficult to get started, but remains well and the quality of the feed is high. When started it brings no expense except harvesting and one top dressing a year. On the college farm it has given twenty-six tons, equalling seven and a half tons of dry hay in a year, being harvested four or five times during the season. It is difficult to get a stand of alfalfa because the plants start spindling and weeds crowd. Some failures are due to lack of lime or fertility, and others to the presence of soil water near the surface. The first cutting is made in the last of May or first of June, and cuttings follow about once a month. It is important to cut regularly, regardless of the amount of growth. Otherwise some seed form and harm is done.

Concerning oats and peas, he says they often fail because not sown early enough; 2 bushels of peas and two of oats make a good mixture. Cows are fond of this feed and make milk of high quality. They should be cut always when the oats are in the milk.

Malted Corn Meal.

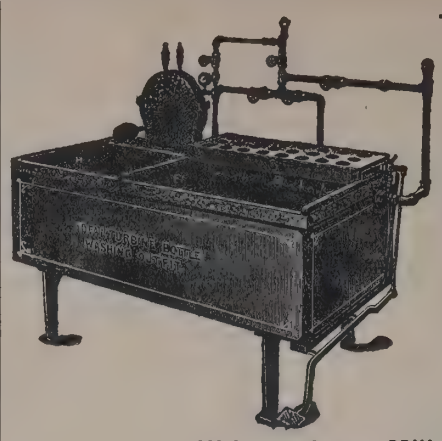
A South Carolina reader asks our opinion of malted corn meal to be fed in the place of cotton seed meal, and which is the best milk producer.

Malted corn meal is a new name to us for a feeding stuff. We apprehend it is a local name possibly for distillers dried grains, and if so we should estimate it to be nearly or quite as valuable as, and in some respects more valuable than, cotton seed meal for milch cows. If this material is not the same or similar to the distillers dried grains we must confess total ignorance on the subject.

"ADVERTISEMENT."

ONE WEEK.

Postum Coffee Re-made the Dominie in a Week.



Where a person has no troubles excepting those caused by coffee Postum Food Coffee if faithfully used will usually act with remarkable quickness. Here is an example even where the coffee habit has been one of long standing.

"I had been a coffee drinker for 20 years and until recently regarded it as one of the 'stays of life'," writes a Tennessee clergyman.

"About a year ago an attack of malaria impaired my digestion and I began to use more coffee than usual thinking it would help my system throw off the malady. During that year I suffered indescribable agonies of nervous indigestion. Finally I noticed that every time I drank coffee for dinner or supper I was much worse. I told my wife I thought it was coffee and that I would quit it and use hot water. Then I thought I would try the Postum we had heard so much about.

"From the very day I left off coffee and introduced Postum I began to improve and at the end of one single week I did not have even the slightest symptom of nervousness and dyspepsia left. It is many weeks now since then and I have not only gained in flesh but am entirely free from indigestion and am strong and happy. My wife had been nervous and her stomach in bad condition and when she saw the change wrought in me followed my example and after using Postum a short time extremely beneficial results followed.

"I am a Methodist minister in charge of a church at Graysville, Tenn." Name furnished by Postum Co., Battle Creek, Mich.

THERE ARE PROBABLY MANY GOOD THINGS
THAT YOU NEED and ought to have, but don't know it.

Here is one of them:

OUR Ideal Turbine Bottle Washing Outfit

We have condensed a whole lot of good things into this outfit. Just packed them up from all around your milk depot and compressed them into one convenient piece of apparatus. Here you have washer, rinser, sprayer, and washing tanks all within easy reach. This is only one of several specialties we have in this line. Our information in this line is yours for the asking.

☞The DeLoach is the only mill made that is shipped to all parts of the world. Over 10,000 in use.

Grit

Grit is a good thing in its place, but a bad thing in butter. Gritty salt—salt that's icy, insoluble, full of lime, chlorides and magnesium, is accountable for many exasperating difficulties of dairymen. It represents a loss of time, labor, money and patience, not always attributed to it. With DIAMOND CRYSTAL SALT—"*the Salt that's ALL Salt*"—your butter difficulties will disappear, and a gain in time, *money* and less labor result. Its dry, pure flakes dissolve quickly, imparting a rich flavor and keeping quality that find ready favor and highest market prices. "Just Salt" is a valuable booklet every dairyman should read. We send it free.

DIAMOND CRYSTAL SALT CO., ST. CLAIR, MICH.

SILOS FROM PUCET SOUND TO YOUR FARM. We shall ship to your town, Silo Stock of Staves One Piece the Depth of Silo. Oregon Pine which owing to length must be handled in car loads, giving to people contemplating the erection of a Silo in 1903 the benefit of through car load freight rates in a delivered price on Silo complete. Write us, giving size best adapted to your wants, and have booklet, "Silos and Silage," mailed you. It shows how to build, how to fill. WILLIAMS MFG. CO., Kalamazoo, Mich.

On a Sewing Machine.

"Young" TOLEDO O

We don't ask you to accept this statement on our bare assertion—*we want to prove it.* We have just issued what is undoubtedly the most thorough and comprehensive book ever published about Sewing Machines. This book tells you what constitutes a *really* high grade machine—how to detect the weak points—the right price to pay, etc. The book is handsomely printed in colors, with photographs and sketches, and includes samples of the work done with the attachments upon cloth—stitching, binding, braiding, ruffling, tucking, quilting, hemming, etc. You should have this book and these samples whether you buy from us or not. The book is free to you for the asking. *Send for samples and booklet No. B-* 5902

Silage With too Much Water.

ED. HOARDS'S DAIRYMAN:—Last fall I put about 40 tons of green corn into an old cistern. I put it in whole without running through feed cutter. Some weeks afterward the cistern sprung a leak and a few days ago, I noticed the water had risen a few inches above the ensilage or corn. Do you think the ensilage is ruined, and what must I do about it? I was not quite ready to feed it yet, wanted to keep it until February. Do you think I had better feed it right away, or get that water out of it? N. F. A

New Providence, Tenn.

This is a new silo condition and we are not at all certain what the effect of the water would be in such a case, when in contact with the silage for a short time. But it is safe to say that the mass will ferment and spoil if the water is not removed. The water can be pumped out by driving a pipe with a drive well, point on it to the bottom of the silage and attaching a pump. It would be safer to feed the silage immediately as there is every probability of its soon spoiling.

Pea and Oat Silage.

A Question for Mr. Langdon.

ED. HOARD'S DAIRYMAN:—I have had great success with alfalfa. I sowed eight acres of heavy clay, and followed the directions of your paper, and I cut three heavy crops last season.

I saw a very interesting article in your paper of Dec. 19th, written by Mr. W. J. Langdon on pea and oat ensilage. Would Mr. Langdon please state whether he wet the peas and oats as he cut them in or not? C. H. W.

Smiths Falls, Canada.

Paint Without Oil.

Remarkable Discovery That Cuts Down the Cost of Paint Seventy-Five Per Cent.

A Free Trial Package is Mailed to Everyone Who Writes.

A. L. Rice, a prominent manufacturer of Adams, N. Y., has discovered a process of making a new kind of paint without the use of oil. He calls it Powdrpaint. It comes to the farmer a dry powder and all that is required is cold water to make a paint weather proof, fire proof and as durable as oil paint. It adheres to any surface, wood, stone or brick, spreads and looks like oil paint and costs about one-fourth as much.

Write to Mr. A. L. Rice, manufacturer, 346 North St., Adams, N. Y., giving the name of the dealer from whom you buy your paints. Mr. Rice will send you a free trial package, also color card and full information showing you how you can save a good many dollars. Write to-day.

SURE CURE! Brooks Appliance. New discovery. No obnoxious springs or pads. Automatic Air Cushions. Binds and draws the broken parts together as you would a broken limb. No salves. No lymphol. No lies. Durable, cheap. Pat. Sept. 10, 01. Sent on trial Catalogue free.

ST. OMER HERD

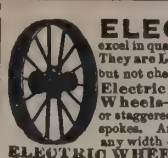
Offers young bulls fit for service, out of tested dams with good yearly records. Strong in Exile of St. L., King of St. L. and Stoke Pogis of Prospect. Reasonabe prices. JOS. T. HOOPES, Bynum, Md

Exile of St. Lambert

—13657—

is the sire of more tested Jersey cows than any bull living or dead, and the number to his credit will probably never be equaled by any other bull. His dam was one of the largest milkers among Jerseys, and is the dam of the three year old cow with the highest year's milk record for that age. Exile's sire is the grand sire of the cow holding the highest milk record for a year.

The mid-winter sale lists include a few tested daughters of this great bull and several cows and heifers deep in the blood that produced this famous sire. If you wish to improve your herd, or to start one, you will probably never have a better opportunity than is here offered. If interested write for lists, and please specify whether bulls, cows in milk, or heifers, are wanted.



WINTERGREEN HILL FARM,
Scottsville, N. Y

Cost of Silage Again.

ED. HOARD'S DAIRYMAN:—It was not that "A Reader" thought a serious misstatement was made that he referred to the article on page 898. The cost of ensilage as given on page 847 from Massachusetts, seems rather high to "A Reader." It was rather the tendency to show farm operations in a too favorable light as regards cost, and not a personal criticism of the writer that was made as the article, page 965, shows. A re-reading will convince both gentlemen, Buff Jersey and Mr. Parsons of this, and also that neither have taken the view he would if he had not assumed a personal attack. The price of labor set for a man, $1; man and team, $2, for intelligent laboring men in these times is low, except as wages obtained in the south where Buff Jersey names $.50. We said the statement was extreme, which Buff Jersey proves by giving more than double the figures of page 898, and nearly harmonious with those offered the original inquirer by the Editor from Wisconsin experience.

As to "A Reader's" price for milk, or experience with silage, or dairying, that is no part of the discussion. Because he wrote from Chicago, it need not be assumed he is not familiar even at short range with handling silage, or farm dairying. He had seen for days flaring posters calling for workmen at $1.50 to $2 per day, and board to go out from Chicago to a number of states with transportation and board. He knows, too, that a little beyond Iowa he has handed over $1.75 per day, and 20 cents per hour, to intelligent farm laborers within the year. So farm wages at $1 per day may seem low yet, as it probably is for the South Framingham, Massachusetts inquirer. The tendency to make farm operations appear too cheap seems objectionable to at least one reader.

In looking back over the pages of HOARD'S DAIRYMAN, on page 844, are editorial comments on the failure of three creameries. May it not be possible that the wages paid the actual workmen had something to do with the failures? With wages higher in other states, the workmen not hampered in movement by families would be likely to move, and scarcity of labor, help reduce the milk supply. A READER.

ELECTRIC HANDY WAGONS excel in quality, strength, durability. Carry 4000 lbs. They are Low priced but not cheap. Electric Steel Wheels—straight or staggered oval spokes. Any height, any width of tire to fit any wagon. Catalogue FREE. ELECTRIC WHEEL CO., Box 130 Quincy, Ills.

FOR SALE. A fine farm in Sargent Co., North Dakota, consisting of seven quarter sections with lease continuing three years on two other quarters. Three Hundred acres in cultivation, six hundred enclosed in four pastures, remainder outlying prairie. Improvements consist of comfortable two story house with eight rooms, a fine barn 101x112 feet with capacity for stabling sixteen head of horses and eighty-four head of cattle in stanchions besides calf stable for twenty head and stable for young stock, besides box stalls for hospital purposes. Two fine silos inside with ninety ton capacity each, besides room for two hundred and fifty tons of coarse fodder, also root cellar 24x24 feet. A creamery 22x40 feet, two story with up to date machinery, a feed mill and elevator 18x32 feet with bins above to hold more than four thousand bushels of grain. Mill is equipped with a three roller mill besides corn sheller and grain cleaner and elevators and spouts and hopper, bottomed bins for the convenient handling of grain. Mill is connected to creamery by a building 20x28 wherein is a water wheel which drives the mill and creamery, also a boiler for steam heating and hot water for use in creamery. This room is also used for carpenter and blacksmith shop. Within this room is also located an artesian well yielding five hundred gallons of clear soft water per minute under a pressure sufficient to drive the mill and creamery. It also provides water on tap in the house and in all parts of the barn and flows off across the pastures making several small lakes and furnishes water on four quarter sections and finally flows off into a natural water way that leads to the Red River of the north. A water wheel at the barn furnishes power for cutting ensilage and other purposes. There is also a granary 18x32 with basement now used for ice house. The house is enclosed in a beautiful lawn of about eight acres wherein is the family garden. Several hundred fine forest trees have also been planted here besides some fruit trees all of which are doing finely. This is one of the finest and most complete plants for general farm purposes and for stock growing and dairying to be found in the northwest. Practical up to date farmers wanting a fine plant should investigate. For particulars address BYRON PARSONS Evansville, Ind.

Yorkville, N. Y., Jan. 15, 1903.

Items from a Maine Dairy.

Ed. Hoard's Dairyman:—Find inclosed clipping from *Turf, Farm and Home*, which was taken from our tally sheets:

I will give you from our tally sheet what a few of our cows have done.

June, gave 1898, 7,014 lbs. milk, test equals 397.8 plus 15 per cent, equals 457½ lbs. butter; 1899, 6,651 lbs. milk, test 6.6, equals 372.45 plus 15 per cent equals 428½ lbs. butter; 1900, 6,571 lbs. milk, test 5.6, equals 367.97 plus 14 per cent, equals 423 lbs. butter; 1901, 6,716 lbs. milk, test, 5.6, equals 376 plus 15 per cent, equals 432½ lbs. butter.

Carribel gave in 1899, 5,173 lbs. milk, test 6.6, equals 392¾ lbs. butter; 1900, 5,547 lbs. milk, test 6.6, equals 421 lbs. butter; 1901, 5,072 lbs. milk, test 6.6, equals 381 lbs. butter.

Beulah gave 1900, 6,743 lbs. milk, test 5.2, equals 405 lbs. butter; 1901, 6,397 lbs. milk, test 5.2, equals 378 lbs. butter.

Dell gave 1901, 5,754 lbs. milk, test 6.1, equals 399 lbs. butter.

Florris, with first calf from March 1, 1901, to March 1, 1092, gave 6.290 lbs. milk, test 5.2, equals 373 lbs. butter.

The best month's work of some of our cows are Daisy in June, 1899, 1,080 lbs. milk, test 5.7; Bess in March, 1901, 1,072 lbs. milk, test 5.2; Beulah in December, 1901, 1,106 lbs. milk, test 5.2; Beulah in November, 1902, 1,049 lbs. milk, test 5.2; Calla in 14 days, ending to-day, 472½ lbs. milk, test 5.6.

From our last churning from the milk from 16 cows and heifers in five days saving of cream, we made 74 lbs., 14 ounces of butter, besides feeding eight lbs. whole milk per day to a calf and using cream on oat meal every morning.

Talk about luck; a few years ago we bought a registered Guernsey bull; in the fall of 1900 out of nine calves, seven were heifers, and in the summer and fall of 1901 out of 12 of his calves 11 of them were heifers. We have now at the head of our herd an 18-months-old registered Guernsey bull from the herd of Edward R. Strawbridge, Morristown, New Jersey, and after his bull Main Stay.

We have eight ½ blood and two ¾ blood Guernseys, three of which are giving milk, and two more will come in in March.

Fernside Dairy,
C. H. Fuller, Prop.

Norridgewock, Me.

Young Grass *vs.* Old.

Would it not be better to cut grass early and get two crops, than wait till later till the grass gets more mature and the seed forms? Would not the last way take more fertility from the soil than the two crops?

I know that there is more milk in light, flushy second crop clover and mixed grasses than in the same bulk of hay. One year we had but little of it, and we fed it extra during the cold snaps and kept our cows up better than ever before.

The next year we had a lot of it and fed it as part of the ration every day, and our cows did better than before or since, as we have been unable to get any till this year, and as the spring and summer have been very hard, our cows are not doing as well as I could wish.

Now, if the first crop could be cut so as to be of as much value as the second, it would be of much more value than is usually the case. C. H. F.

Skowhegan, Me.

Young grass cut while in blossom is much superior to that which has gone to seed. In this latter state most of the nutriment is either enclosed by the cellulose of the stalk or else is packed in the seeds, from which the stomach is unable to extract it, and it goes into the manure unused. Well cured, young grass will always give better feeding results than a more mature variety, that has formed seeds.

Feeding City Swill to Swine.

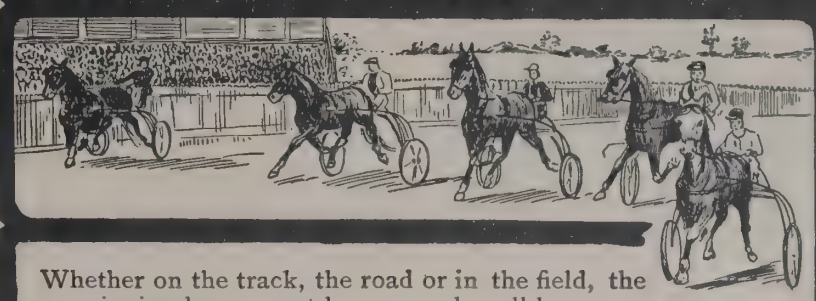
Ed. Hoard's Dairyman:—I reply to T. B. N. of Frankfort, N. Y. in your issue of January 23, 1903, about feeding city swill to swine, I would say that the swill is too rich and contains too much grease for swine and is injurious if fed continually to either young or old swine.

If T. B. N. would feed oats in the morning, swill for noon and bran mixed with potatoes or turnips, and alternate ashes and sulphur, once a week, he would soon see an improvement for the better.

Swill should not be boiled, but I would advise warming. G. W.

Liberty, N. Y.

Farm Wagon Only $21.95.



In order to introduce their Low Metal Wheels with Wide Tires, the Empire Manufacturing Company, Quincy, Ill., have placed upon the market a Farmer's Handy Wagon, that is only 25 inches high, fitted with 24 and 30-inch wheels with 4-inch tire, and sold for only $21.95.

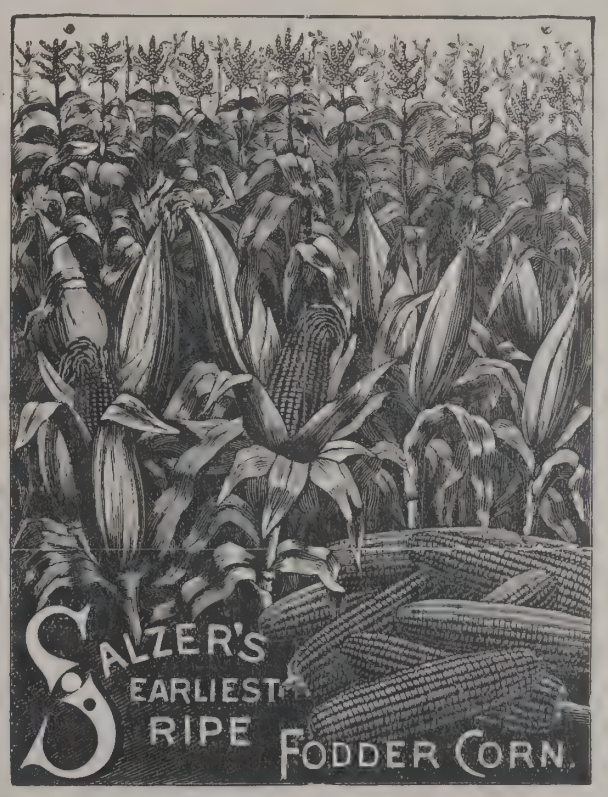
This wagon is made of the best material throughout, and really costs but a trifle more than a set of new wheels, and fully guaranteed for one year. Catalogue giving a full description will be mailed upon application by the Empire Manufacturing Co., Quincy, Ill., who also will furnish metal wheels at low prices, made any size and width of tire to fit any axle.

Cream SEPARATORS All about them and other things for the dairy and creamery.
A. H. REID, - Philadelphia, Penn.

A WINNING HORSE

Whether on the track, the road or in the field, the winning horse must be a sound, well horse.

Mexican Mustang Liniment



is the long time friend of the horse; the surest cure of the many ailments which beset him. It cures his sprains, stiff joints and lameness, reduces swelling and inflammation, soothes and heals barbed wire cuts, wounds and sores. It is the liniment which

Stands the Test of Time.

It has been in constant use for over sixty years. Fathers and grandfathers of this generation testified to its high curative powers for horse and man. Modern scientific discovery has not given us an equal to it in the present day. **Mustang Liniment** penetrates through the well parts, leaving them unimpaired, and gets right down to the seat of the injury, no matter how deep-seated it may be. If you have never tried it, you have been without the sovereign horse remedy of the world. If you would be guided by the experiences of millions of users, covering a large part of the last century, buy your bottle from any liniment dealer. **Three sizes, 25c, 50c and $1.00.** Largest size is cheapest. Don't fail to write us for our little book, **"Points from a Horse Doctor's Diary."**

LYON MANUFACTURING CO., 41-45 South Fifth St., Brooklyn, N. Y.

Early Ripe Fodder Corn.

This corn has leaped with one wild bound into popularity and nothing that we have ever sold has given such great satisfaction. Everywhere throughout the United States, where Salzer's Early Ripe Fodder Corn was planted, it surprized and delighted, and pleased and astonished the grower.

It Was Ripe In 60 Days

and furnished magnificent feeding Corn just at a time when farmers were short of Corn. If you plant this early, you will have fine feeding Corn by July, when you can replant same and have good Fodder Corn in September. This is the most wonderful Ensilage Fodder Corn in the world. Our catalog gives full description.

Salzer's Superior Fodder Corn.

This variety is late, but it's the greatest Fodder Corn on earth. Here are two testimonials from wide-awake farmers that will tell you what they think of this remarkable Fodder Corn. It is far ahead of such varieties as B. and W. corn, when big ears, full ears, and lots of them, together with enormous quantities of leafy, rich Fodder are desired:

Chas. E. Brandel, Truesdell, Kenosha county, Wis., says: "The Salzer Superior Fodder Corn that I got from you last spring is truly a great and wonderful Corn. Planted it the latter part of June and some of it nearly ripened before the early frosts. There are two big ears on almost every stalk, and if it had been planted earlier, there would have been magnificent Corn, thoroughly ripened."

"Racine, Wis., Sept. 14—Out on my farm we planted nearly five acres of your Salzer's Superior Fodder Corn, and it is a sight. From one square rod we cut and bound 450 lbs., and this, I believe, is at the rate of 36 tons (72,000 lbs.) per acre.—C. C. Beebe."

OTHER FODDER PLANTS. Salzer's Catalogue is brim full of rare Fodder plants for the dairy. There is nothing in the world better than Salzer's Teosinte, yielding 100 tons of green Fodder per acre, Salzer's Billion Dollar grass, with its 12 tons per acre, and Salzer's Thousand Headed Kale, Dwarf Victoria Rape, Bromus Inermis, Kaffir Corn, Sand Vetch, Jerusalem Corn and the Giant Spurry are but a few of the things found in Salzer's Catalogue.

FOR 8c. If you will mention Hoard's Dairyman when you write, we will send you a sample package of the Earliest Ripe Fodder Corn and Salzer's Superior Fodder Corn, the two best Fodder Corns on earth, together with our great Catalogue, well worth $100.00 to the wide-awake dairyman and farmer.

JOHN A SALZER SEED CO., LA CROSSE, WIS.

5,000 Farmers

ordered fence direct from our factory this year. Many of them had done so before and had found that our

ADVANCE FENCE

fit their requirements exactly. Of course the price had much to do with this. When a farmer can buy the best fence on the market at manufacturer's prices, he finds it a good and safe investment. It's so good you will order the second and third time. Your name and address on a postal card will bring circular and special prices. Have fence ready when you need it.

ADVANCE FENCE CO., 126 C St., Peoria, Ill.

TURKESTAN ALFALFA,

the wonderful forage crop which we introduced generally last year has easily surpassed all expectations of it. Trial has demonstrated these points of superiority over ordinary alfalfa: **It is hardier, stands drouth and freezing better, sprouts and starts quicker, grows faster and makes greater yield, gives better results in alkali soils and produces five crops a year.** Being the first to handle it we are **headquarters for the best imported seed.** Try it this season without fail. New, large, illustrated catalogue—**a thousand things for farms and gardens, mailed free.** Write for it at once.

Sherman, N. Y.

This Tubular Fence Post

made of Galvanized Metal, will not rust, rot nor burn, and will last a lifetime. Cheap as the best wood post. Takes any kind of woven, barb or smooth wire fence. Made plain or ornamental. For farm, lawn, cemetery, etc. Circulars and prices on application.

Bloomfield Mfg. Co. Box 104, Bloomfield, Ind.

VETERINARY.

Queries in this department answered by DR. A. H. HARTWIG, Watertown, Wis.

Indigestion.

What will stop my 9-months old calf from eating old sacks, leather, rubber, paper and boards? I feed her milk and water from gravity separator, some mixed feed with what hay she will eat. Have fed her lately a little cotton seed meal and bone meal. SUBSCRIBER.
Newport, N. H.

ANSWER.

Your calf has an attack of indigestion, hence the craving for unnatural substances. Give her a teaspoonful of bicarbonate of soda in each drink of milk and feed light until the trouble has subsided. Discard the cotton seed meal at once.

Diseases of Animals.

Does the book Diseases of Horses and Cattle by Prof. D. McIntosh tell what remedies to apply for the treatment of their diseases? H. A. H.
Colebrook, N. H.

ANSWER.

The above book gives the symptoms of disease and remedies to be used. It can be obtained from this office for $1.75 post paid.

Dose of Nux Vomica.

I read in the DAIRYMAN of feeding cows nux vomica to make them come in heat, but I have lost the number in which it was printed, so I do not know how much to give them.

We are feeding the milk cows a mixture of 2 parts bran, 1 of corn meal and 1 of gluten meal. We feed the fresh cows 12 lbs. of the mixture daily and the ones that do not milk so much, are getting less. Our rough feed is drilled corn fodder at night and shredded fodder and oat hay in the morning. G. A. S.
Stitzer, Wis.

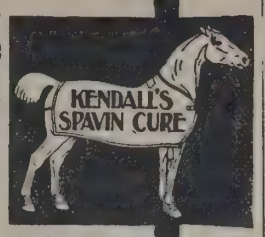
ANSWER.

The dose of nux vomica in your case would be 1 dram once daily in food, to be continued about two weeks or until successful. If you are obliged to continue longer than two weeks, it is best to rest a week or so and then begin again.

Six lbs. of bran, 3 lbs. corn and 3 lbs. gluten meal makes a very generous ration. We think you might take out at least one pound of corn meal and the same amount of gluten meal from the daily allowance.

You Can Save Your Horse

from **Spavin, Ringbone, Splints, Curbs and all forms of Lameness** by a prompt and liberal application of that old reliable and well known remedy—



Kendall's Spavin Cure

It has the unqualified endorsement of every man who has ever used it. Here is a sample of what thousands say for it.

WORTH $200 TO THIS MAN.

Astora, Ills., May 22nd, 1900.

Dr. B. J. Kendall Co., Messrs:—Please send your Treatise on the Horse and his Diseases. Your liniment **saved a horse** for me that I expected to get $200.00 for. It can't be beat and I will be very thankful for the book. Respy, C. A. CREBBS.

It is a most valuable liniment for family use—splendid for bruises, sprains, lame back, rheumatism, etc., etc. Sold by all druggists at $1; six bottles for $5. Our book, "A Treatise on the Horse," mailed free. Write at once and address

DR. B. J. KENDALL CO., Enosburg Falls, Vt.

"SAVE-THE-HORSE"
TRADE MARK

SPAVIN CURE

Need one wonder why our written guarantee, wh ch accompanies every bottle, was constructed so it is equivalent to a bond?

SPRING VALLEY, N. Y.

About two months ago our mare became suddenly very lame in front leg between the knee and fetlock and, after using liniments, it became no better so I concluded to try "Save-the-Horse", as I reckoned no h use could afford to give the guarantee you give on a worthless thing. I procured the medicine and followed instructions to the letter and on the fifth day the lameness was nearly all gone. Two days later I began driving her short distances and every day a little further and kept up the treatment another week and since then she has not been lame a minute. I think it is a great remedy and have told a number of people about it. The price is what kept me from trying it before, but now that I have seen what it has done I think it is cheap. I have about two-thirds of the bottle left. Wishing you the success that "Save-the-Horse" certainly deserves, I am,

Yours very truly, WM. F. KUNTZ.

GREAT NECK, L. I.

On September, 19th., 1902, I procured a bottle of your "Save-the-Horse" for use on a bog spavin which had begun to be very prominent, in fact I believe it to have been about fully developed. The directions for use were adhered to minutely and before the contents of the bottle were used the spavin was a thing of the past and to-day not a sign of spavin or mark of any kind whatever remains. I appreciate the value of this remedy and it has been my intention to advise you as to the result before but it has been delayed. Anyone interested and doubtful of this cure (as I admit I was) may write me and I will state just what kind of a case it was, etc.

Respectfully, H. A. BAXTER,
Real Estate, Insurance & Investments.

Horse can be worked with either shin or ankle boots as no harm can possibly come by either destruction of hair or scalding of the limb. "Save-the-Horse" can be applied in all conditions and extremes of weather—hot or cold.

Positively and Permanently Cures

Bone and Bog Spavin, Ringbone, Curb, Thoroughpin, Splint, Chapped Hock, Shoe Boils, Weak and Sprained Tendons, and all lameness.

Contains no arsenic, corrosive sublimate or other forms of mercury, or any injurious ingredient.

Cures without scar, blemish or loss of hair.

$5.00 PER BOTTLE.

Written guarantee with every bottle, constructed to convince and protect you fully. The need of second bottle is almost impossible except in rare cases. Guarantee covers effectiveness of one bottle.

Copy of guarantee sent upon application.

$5.00 at druggists and dealers, or sent prepaid.

TROY CHEMICAL CO., TROY, N. Y., - Manufacturers.

The Progress of Dairy Education in Michigan.

ED. HOARD'S DAIRYMAN—We are congratulating ourselves on the fact that 116 young men have found it possible to come to the college for our Special Courses this winter. This number is largely in excess of any attendance we have had in the past. It bodes well for the agriculture of the state when the young men are ready to devote themselves enthusiastically to farming. It indicates that it pays as a business and that it makes possible a happy life while accumulating money. Of this number 57 are taking the course in creamery management. Most of the se young men have had experience in creamery work; some a few months only, and many of them for several years. Not a few have taken the short course previously. I know that your paper will feel like congratulating our state on this evidence of renewed activity along dairy lines. There is much need of better education of milk producers and creamery men in Michigan. By far too large a proportion of our butter is still made in the farm home with inadequate facilities and with bad methods. I am using every influence within my power to bring about a condition where the butter shall be made in the factory by men trained for the work. Our dairy school is pledged to this revolution.

Perhaps the chief characteristic of our dary school lies in the fact that a student is in the butter room each alternate afternoon and either separates or churns or does some other important work connected with the operation of making butter. This fact explains how we can hope to train men in so short a time. They are at practical work every day and at the purely technical work of butter making, each alternate day. Thus they get so well acquainted with methods and operations that correct methods become a habit. We have never had a brighter class of young men and I bespeak for them opportunities in well located factories in the immediate future.

I appreciate the great work your paper is doing for the dairy industry not only in Wisconsin but in the whole community and I want to assure you of our hearty co-operation in all your endeavors. C. D. SMITH, Dean.

Agricultural College Mich.

Feeding City Swill to Pigs.

ED. HOARD'S DAIRYMAN:—I see in your last number of the DAIRYMAN your correspondent from Frankfort, N. Y., is having pigs die by feeding city swill. I think I can tell him the cause as my wife is the originator of the idea that caused pigs to die by feeding city swill.

In 1895 we had a friend visiting us from Tully, N. Y. She said her son was running three hotels at a summer resort at Tully, was feeding a large number of pigs the refuse of the hotels and had lost about 40 pigs and two or three breeding sows up to that time. And the idea occured to my wife that it was caused by feeding dish water that contained Gold Dust, Snow Boy and other powders that are used for washing dishes.

I immediately wrote to my friend what we thought caused the death of his pigs. He discontinued feeding dish water and had no further trouble. About this time there were several other cases reported near Oswego and other parts of the state.

Dr. Veranus A. Moore B. S. M. D., Professor of Pathology, Bacteriology and Meat Inspection, New York State Veterinary college, Cornell University, Ithaca, N. Y. and other Professors from Cornell University, had been looking after these cases, but had not come to any conclusion as to the cause. Professor Moore was visiting at our place about this time On learning the experience of my friend from Tully, started home immediately, bought a litter of pigs, divided them up in four separate pens and commenced experimenting by feeding dish water that contained washing powder, to two pens, the same feed to the other two without the powder. The result was the pigs fed the powder died. The pigs in the other two pens fed the same without the powder thrived and did well.

The Agricultural Department at Washington, published a Bulletin, the result of Professor Moore's experimenting.

This powder eats the stomach and intestines and causes death. Will your correspondent please report after discontinuing feeding dish water.

THE COMING DAIRY COUNTRY

Probably the richest farming country open for settlement to-day on the American continent, is the fine hardwood belt extending along the Minneapolis, St. Paul & Sault Ste. Marie Railway ("Soo" Line) in northern Wisconsin and Michigan. Acknowledged by good authorities on dairying to be the best dairy region in America. A land of Clover and Blue Grass well supplied with streams, lakes, and springs of pure water

W. D. HOARD, Editor of Hoard's Dairyman, says:

"I believe that northern Wisconsin is going to prove the most successful dairy region of the northwest, something like that of St. Lawrence and Lewis counties in New York.

"The peculiar salubrity of the air, the moderate heat of summer, the abundant and pure water, the good soil and luxuriant growth of grasses, all conspire to make it an ideal dairy region."

CHOICE LANDS AT LOW PRICES.

If you want a home in the "Great Clover Belt" write for free illustrated folder to **D. W. CASSEDAY, Land Agent "Soo" Line, Minneapolis, Minn.**

HARDWOOD TIMBER LANDS

from which the older trees have been cut but mostly covered with a fine growth of young timber, located in Marathon County, Central Wisconsin, are now offered for sale by us on most favorable terms to actual settlers.

This is some of the very best hardwood agricultural land in this state, with a deep, clay loam soil, gently rolling, with water easily obtainable at from 16 to 24 feet.

There is no better land for grain, grasses pastures, oats, peas, fruits or livestock, etc. Particulars will be furnished promptly on application.

Mr. Wheaton's Canadian Dairy Notes.

Canadian Dairy Conventions—Patron Delegates to Convention—Creamery Instruction — Value of Cold Curing of Cheese.

ED. HOARD'S DAIRYMAN:—January is dairy convention month in Ontario. The conventions this year, the Eastern at Ottawa, during the first week, and the Western at Brantford during the second week of January, were of the usual character.

The attendance on the whole was good, though it is to be regretted that the farmers do not patronize these gatherings as much as they should. Some effort should be made to get a sprinkling of patrons present. Why would it not be a good plan to encourage factories to send representatives to these annual conventions. One good live patron from each factory, brought in direct touch with the enthusiasm and inspiration to better work, which these conventions foster would go along way towards improving the quality of the milk received and bringing about better factory buildings and equipment.

A patron delegate to either of these gatherings. who would report to the annual meeting of the factory, which sent him, could exert a marked influence in working out the reforms so much needed to bring about an improvement in the quality of our dairy products. If a couple hundred of such delegates were present at each convention, taking notes of what was said and done, speakers would exert themselves more to make an impression and would boil down their "rambling" remarks into some concise form for taking away more readily.

As we will show later, the work of instruction is likely to be taken from the control of the associations and placed more directly under Government supervision. Here, then, is a new field for the associations to enter upon, whereby they can increase their usefulness and power to a very large extent. It might be good policy to encourage factory delegates to attend ,by appropriating a small amount towards the expense of the trip. It would do no harm, at any rate, to extend a special invitation to factories to appoint delegates to the annual conventions. There is need of more co-operation among factories, and this might be a means of bringing it about. As it is at present, the patrons of factories, even in the district where the convention is held, are conspicuous by their absence.

The gatherings this year seemed to be more than ever before, meetings of makers and manufacturers. The program was prepared specially for their benefit and they turned out in goodly numbers to listen to it.

The two chief features brought to their attention were the benefits to be derived from the cool curing of cheese, and the movement for the reorganization of the instruction work of the province. The former were presented to the conventions by Prof. Robertson and J. A. Ruddick of the Department of Agriculture at Ottawa, and the latter by the Hon. Mr. Dryden, G. C. Creelman, G. H. Barr and G. G. Publow.

A general outline of these two new features in dairy work in this province has been given to readers of the DAIRYMAN in previous letters. A further reference, however, will not come amiss, especially as they mark the beginning of a new era in connection with co-operative dairying in Canada.

As presented by Mr. Ruddick experiments conducted at the four consolidated curing stations during the past season, as to the value of cold curing over the ordinary factory methods, are well shown by the following table:

PLACE.	No. Cheese	Weight Pounds.	Shrinkage Saved %.	Am't Saved in Shrinking, Lbs.	Value at Sale Price
Woodstock ..	11,657	906,565	1.58	14,327	$1,424.13
Brockville...	6 644	526,950	1.52	8,050	814.48
C wansville .	6,266	491,295	1.34	6,640	652 02
So.Hyacinthe	1,964	143,190	1.66	2,586	238.41
Total.....	26,531	2,070,996	1.51	31,403	$3,139.04

From this table it will be seen that in curing at a temperature below 60° there was a saving of 31,403 lbs. on 2,070,996 lbs. of cheeee, or 1.51 per cent. In money value this meant a saving of $3 139 04, enough to put a good many curing rooms in shape to control the temperature.

But the shrinkage is not all. The quality of the product was found to be very much improved, which should add a few thousands more to the saving in money value alone from improved curing methods. Here is something for patrons and factory owners to consider.

If the consolidated curing room idea never develops further and does not become any more important factor than at present in the curing of cheese, it has most clearly demonstrated the value of curing cheese at low temperatures. Many consider that, owing to the jealousy existing among factories and the large cost of the consolidated curing station, the movement will not be taken up by the factories generally. However, that remains to be seen.

We have explained on former occasions the syndicate work undertaken last season by the Ontario Department of Agriculture. The results from it have been so successful that the department is warranted in extending it over a wider area the coming season. To do this successfully it seems in the best interests of all concerned to consolidate the work of instruction formerly carried on by the associations, and to divert a portion of the annual grant to this more concentrated and uniform effort.

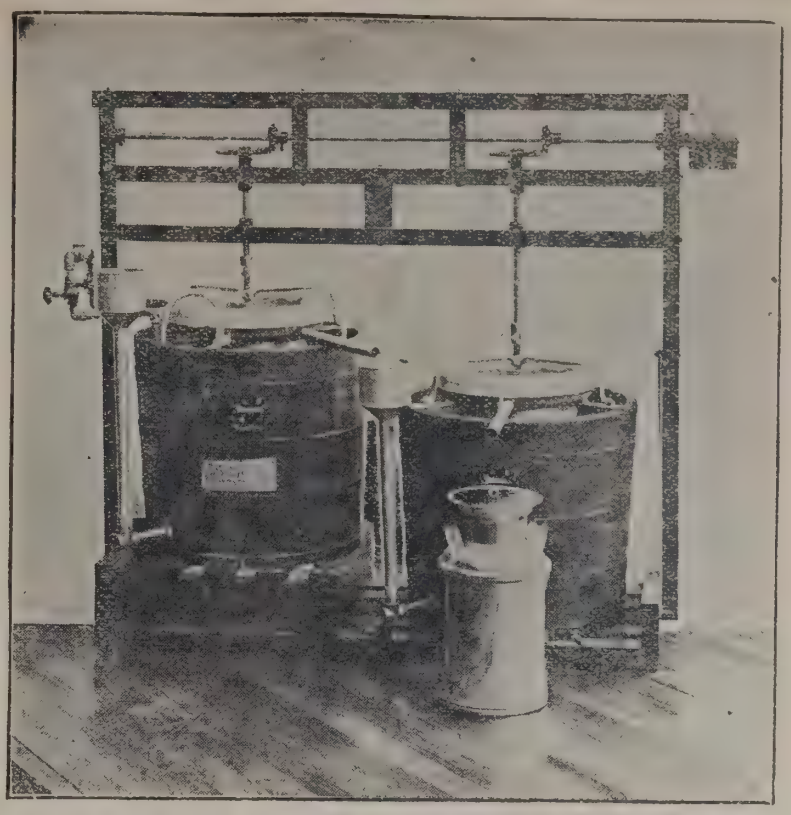
The exact details of the new scheme have not been worked out yet. The plan in general terms is to have two chief instructors, one for the east and one for the west, who will be under the direct control of the government. A number of sub-instructors will be employed, who will be guided and controlled by the chief instructors. The aim will be to organize as many of the factories as possible into groups or syndicates with an instructor over each.

The system of instruction will include cheese making, dairy buildings, as to sanitation and cleanliness, and such instruction for the patrons, who furnish milk to the factory, as may be necessary to insure a better product.

A welcome visitor to the Convention this year was Major Alvord, Chief of the Dairy Division at Washington. In his addresses he dealt chiefly with what has been accomplished in the United States for the dairy industry through organized effort, and by the expenditure of public funds to advance the industry. His addresses were listened to with interest by our dairymen.

From what we have said so far it may be inferred that the conventions were largely given up to cheese discussions. But such was not the case. Though as much time was not given to the discussion of butter, as many would have liked to have seen, and as might well be given to this important branch of dairying, still it was not sidetracked by any means.

One half day was given up entirely to the practical side of butter making, during which Prof. Dean and several other authorities gave some valuable information on the subject. The discussion turned to some extent upon the relative values of the cream gathering and separator plans of conducting creameries. The former plan is growing rapidly in sections where dairying is not made a specialty, and beef cattle production is largely carried on. Starting on this basis, the farmers are loth to give it up. The general trend of the discussion went to show that where the cream was properly taken care of and handled properly at



FOOD FOR A YEAR.

Meats.....300 lbs.
Milk.....240 qts.
Butter.....100 lbs.
Eggs.....27 doz.
Vegetables.....500 lbs.

This represents a fair ration for one man for one year.

But some people eat and eat and yet grow thinner. This means a defective digestion and unsuitable food. To the notice of such persons we present Scott's Emulsion, famous for its tissue building. Your physician can tell you how it does it.

We'll send you a little to try if you like.
SCOTT & BOWNE, 409 Pearl street, New York

A GREAT SUCCESS.

The Miller Cream Pasteurizer has a capacity of from 450 to 600 lbs. per hour.

Price $150 in Tin. $200 in Copper.

Take the Short Cut to Best Results
in feeding of all kinds of live stock, either for growth and rapid development, putting on fat, or increasing milk, etc. by feeding

Prussian Stock Food.

It not only increases the product thereby reducing the first cost, but it wards off disease and keeps the animals in a more thrifty and healthy condition. As a general proposition read what it has done for this man.

GENTLEMEN:—I have fed Prussian Stock Food to my horses and obtained splendid results. The improvement in condition and spirits was remarkable. My milk increased 15 per cent by factory weight on this food during the dry weather. I heartily endorse its use. A. L. SMITH, Dundee, Mich.

Ask your dealer for it. If no agent in your town, write us for special terms, etc. We mail 68-Page Book on Stock Feeding Free.

PRUSSIAN REMEDY COMPANY, ST. PAUL, MINN.

the creameries, a very good quality of butter could be made by the cream gathered system.

At the Brantford meeting a good winter dairy exhibit was shown. The cheese, with the exception of some bad flavored ones in the September make, were of good quality. The judges criticised severely the general absence of cap cloths from the cheese. These should be on every cheese and pressed into it the same as the bandage.

The butter exhibit was good, especially that in boxes, which was pronounced to be exceptionally fine. This was winter made butter and entirely dispels the idea prevalent a few years ago, that good butter could not be made during the winter. The butter makers were criticized for not using more and better parchment paper on the boxes.

The old officers were mostly re-elected, the only change on the eastern board being the replacing of Henry Wade by Henry G'endinning, of Manila; on the western board, James Connolly, Porter Hill, Ont., was elevated to the president's chair, and ex-president Wengen made Hon vice-president. There are two new directors, John McQuacker, Owen Soundand Mr. McLeod of Vanneck, both butter men. J. W. WHEATON.

Toronto, Canada.

A Question in Ventilation.

Mr. F. A., of Deerfield, Wis, writes that he expects to build a barn next summer, 40 by 46 feet and will have the stable made as nearly air tight as possible. He asks in that event if it will be neccessary to have as many square inches of intake air flues as of outlet air flues. He also asks if there is any device for running a small churn with the ordinary wind mill.

In the first place, we suggest to Mr. A. that he consider, perhaps more carefully than he has done, whether the dimensions given are most appropriate for his purpose. Our personal opinion is that a barn 32 feet wide inside measurement is ample for a stable and we should prefer to have the additional room in length rather than in greater width. However, these are matters that every man must settle for himself according to his own ideas of what will be most convenient and available for his purposes.

In regard to the matter of ventilation, it may be stated that there is no necessity for having quite as many square inches of intake as of outgo, but it is well to provide for both very amply, as it is much easier to stop them down with slides than it is to increase the size after they are once in the building.

We do not know of any working device for running a small churn with an ordinary windmill. Mr. C. P. Goodrich, when on his farm in the town of Oakland, used to do most of his churning with wind power. He is now absent in Michigan in Farm Institute work, but when he returns we will endeavor to call his attention to this inquiry and try to get what information we can from him on this subject.

DON'T PUT OFF

Seeing your friends and having them join in for a good club of subscribers.

A Great Old Cow.

Sweet Briar, a cow of the Minnesota Experiment Station dairy herd, has probably the most complete official record of any cow that has ever lived. She is now in her sixteenth year and although she has given birth to fourteen calves and has been worked up to her full capacity every year she is still in the dairy business. She was brought to the Experiment Station in October, 1891, and since that time has been on experimental work continually. The books in the dairy office show the kind and amount of feed she has consumed each day and the quantity and quality of the milk she has produced at every milking during the eleven years she has been at the Experiment Station. This cow's record ought to show a few things worth considering and worth knowing. It is generally supposed that a cow's usefulness is past at ten years, in so far as profit goes. Sweet Briar is past fifteen years and is still profitable. Again, it is supposed that pure-bred animals are less vigorous and shorter lived than scrub animals. This cow is pure-bred Guernsey and her ancestors have been bred pure for generations, yet she has outworked and outlived every scrub cow of her age that has ever been in the herd with her. While it may be true that most cows are past their period of usefulness at ten years and that the pure-bred animals are more delicate than the common stock, it does not follow that this must continue to be the case. Sweet Briar's record shows that a cow may be so cared for as to increase her period of usefulness one-half and she may be so bred as to possess the higher dairy qualities and still be as vigorous and long-lived as the native stock.

The following table shows the quantity of milk produced, the average per cent fat, and the number pounds butter made from October, 1891, to October, 1901:—

'92	6510.3	5 22	396 19
'93	7352.0	5.00	428.72
'94	4515.6	5.03	265. 0
'95	7534.1	4.96	435 75
'96	6634.0	4 86	374 83
'97	7770.9	5.41	491.00
'98	3501 3	5 06	206.62
'9	530..9	4.95	306 53
'00	5491.7	4.76	305.18
'01	6845.8	4.64	370. 9
Av for 10 yrs	6142 76	4.98	358.07

It will be seen by the table that in no one year did she make what would be considered a great record. Two different years she dropped below 300 pounds. If these happened to be the only years in which a record was kept of her work she would be considered a poor cow, while the average for ten years show her to be a very profitable cow. This emphasizes the danger of drawing conclusions from short experiments.

Sweet Briar is a cow of rather large frame though only medium in weight, about 1,100 pounds in her prime condition. She never carried very much flesh, never was a very large feeder and never gave very large quantites of milk but she kept everlastingly at it, and has not quit yet. She will hardly sell for beef when she is of no more use for milk, but it is not necessary that she should. In her fifteenth year she has made enough butter to pay for two beef cows larger than she is. This old cow's record will be published in full some time later in bulletin form and will give valuable information in dairying.—*Minnesota Farm Students' Review.*

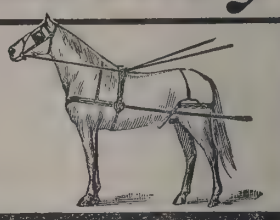
That old copybook maxim finds its most forceful application in the waste of vitality, which is called "burning the candle at both ends." A woman is often tempted beyond her strength by domestic or social demands. Some day she awakens from this waste of strength to the woeful want of it. She has become weak, nervous and miserable.

For weak, nervous, run-down women, there is no better tonic and nervine than Dr. Pierce's Favorite Prescription. It restores the appetite, quiets the nerves and gives refreshing sleep. It cures local diseases peculiarly womanly which undermine the general health. It makes weak women strong, sick women well.

"No doubt you have forgotten me, but after you read my letter you will remember me," writes Mrs. Annie E. Moring, of 238 7th Avenue, S. W., Roanoke, Va. "In the year 1897, I wrote to you for advice, which you gave me free of charge. When I wrote to you I was a wreck; I could not walk straight for pains in my abdomen; could not sit down, lie down, or get any ease at all. I had what was called the best doctor here, but did not get any better until I went through a course of your medicine. I took eight bottles each of 'Favorite Prescription' and 'Golden Medical Discovery,' and ten bottles of the 'Pleasant Pellets.' I tell you the medicine made a cure of me."

Weak and sick women are invited to consult Dr. Pierce, by letter, *free*. All correspondence is held as strictly private. Address Dr. R. V. Pierce, Buffalo, N. Y.

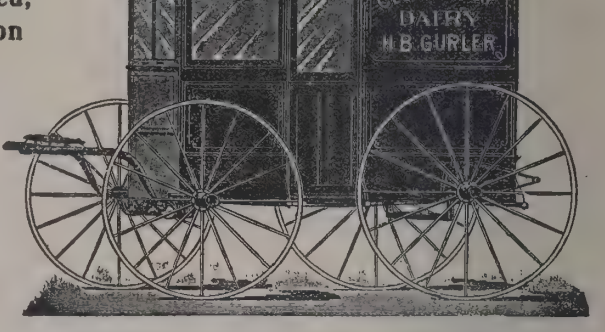
Dr. Pierce's Pellets cure biliousness.



We Sell Direct.

It is foolish to pay two or three profits on a carriage or harness. We sell at unequaled low prices, not because our goods are "cheap," but because we save heavy expense and the middlemen's profits by our direct way of selling.

From THE Factory



You pay the exact cost of manufacturing with one fair profit added. We guarantee satisfaction or refund money and pay freight both ways. If you need a carriage, harness or any horse goods write for our catalogue *now*—it is *free*.

GREAT CROPS OF STRAWBERRIES

AND HOW TO GROW THEM

The best book on strawberry growing ever written. It tells how to grow the biggest crops of big berries ever produced. The book is a treatise on **Plant Physiology** and explains how to make plants bear **Big Berries and Lots of Them.** The only thoroughbred scientifically grown **Strawberry Plants** to be had for spring planting. One of them is worth a dozen common scrub plants. They grow **BIG RED BERRIES.** The book is sent free to all readers of HOARD'S DAIRYMAN. Send your address to

R. M. KELLOGG, Three Rivers, Mich.

A Cream Question.

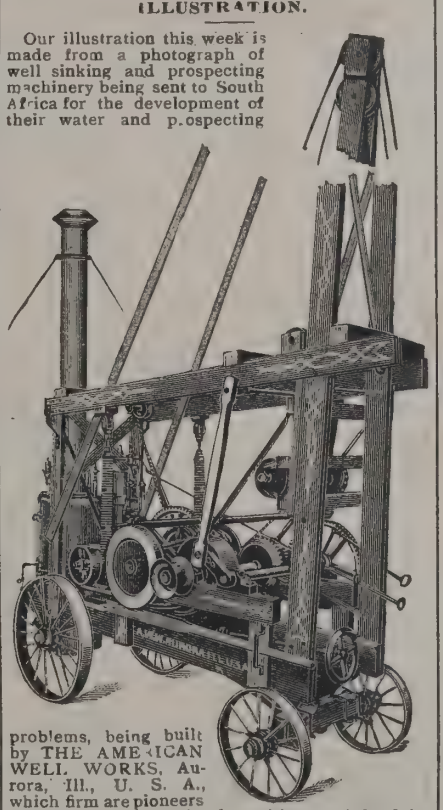
ED. HOARD'S DAIRYMAN:—Inclosed please find creamery statement which I want your opinion on.

I send you five months of the statement, during which time my separator cream screw has been set exactly the same. I have turned the machine and timed myself by the clock so as to run it at as uniform speed as possible. The milk was from the same 14 cows (clover pasture), on the same feed all the time, none of them have been sick, they have been milked regularly in the stable and by the same milkers all the time. My machine is nearly new. This is the second season's run.

	Lbs. cream.	*Test.*
May 15	1,117	23.00%
May 30	1,211	22.00%
June 15	1,140	20 50%
June 30	1,118	21.00%
July 15	989	21 30%
July 30	924	23.20%
August 15	986	19.50%
August 30	830	19 80%
September 15	912	20.50%
September 30	866	20.80%

In the statement between July 30th and August 15th there is a variation of 3.70 per cent. Do you think it could be under the conditions named and be correct? I ask this because I have confidence in your judgment and fairness. The tests are made from a composite sample.

Our cream is gathered by boat. If you know of any convenient way of locking cans to prevent theft while in transit please let me know.



Gardiner, Ore. H. F. Mc C.

One of the impossible things in dairying is to so run a separator as to always obtain cream of the same richness in butter fat. This is owing to the large number of conditions that affect the separation. The richness of milk, temperature, speed of separator and rate of separating—all and each have an influence on the quality of the cream, and owing to the impossibility of obtaining like conditions, there may be a variation of as much as 10 per cent in the amount of butter fat in the cream.

There are various cans on the market that can be locked. Perhaps the simplest method is to make a hole in the edge of can and of cover and run the loop of a padlock through the holes.

ILLUSTRATION.

Our illustration this week is made from a photograph of well sinking and prospecting machinery being sent to South Africa for the development of their water and prospecting problems, being built by THE AMERICAN WELL WORKS, Aurora, Ill., U. S. A., which firm are pioneers in the west of this style of machinery. It is of the most simple construction consistent with its large range of work. The submerged flue boiler is of ample capacity, the engine is of a vertical reversing type, especially built for such work, belted to double crank walking beam which makes them susceptable to the highest rate of speed.

If in need of compressed air, steam or power pumps or gasoline engines remember the firm with your specifications.

MINNEAPOLIS MINN.

THE WEAR OF RUBBER BOOTS AND SHOES DEPENDS UPON THE RUBBER IN THEM.

There is absolutely no wear in any of the other ingredients of which they are composed. Every time the quality of Rubber Boots and Shoes is reduced 10 per cent., the durability is reduced over 20 per cent. because there is only one way to cheapen them, and that is to leave out Rubber and put in its place other things that have no wearing quality whatever. This cheapening process has been steadily going on for the past 40 years.

THE

BUCKSKIN BRAND

OF RUBBER BOOTS AND SHOES

are made of real rubber—and one pair of them will outwear two pairs of the standard first grades now on the market. Try a pair and be convinced. Made in Duck Boots, Duck rolled edge Overs for Socks, and Felt Boots and in Arctics and light rubber shoes.

Insist on getting the BUCKSKIN BRAND. None genuine without the word BUCKSKIN on the top front of the legs of the boots and the bottoms of the shoes. If your dealer does not keep them write us and we will see that you get them either through some dealer in your town or from us direct. We will also send you a very interesting catalogue profusely illustrated, which describes the making of Rubber Boots and Shoes from the gathering of the rubber to the finished goods.

Made for the Man Who Wants the Best.

The Great Western Endless Apron Manure Spreader.

SPREADS all kinds of manure regardless of their condition, handles barnyard manure that has been tramped so hard that it is necessary to loosen with pick, fresh stable manure, containing wet or dry straw, corn stalks, etc. Old straw stack bottoms, whether rotted or not. Cow manure fresh from the gutter, sheep manure, lime, salt, ashes, and in fact all kinds of manure and fertilizers and does it quicker, better and more evenly than by hand. Spreads as much manure in one day as 15 men can by hand. Spreads the largest load in 2 to 4 minutes. Makes the same amount of manure go three times as far and produce better results. **NON-BUNCHABLE RAKE** which forms a hopper and holds all hard chunks of manure in contact with beater until thoroughly pulverized before discharging, therefore no bunching or uneven work. The **ENDLESS APRON** is one continuous apron (Not a ½ apron) and therefore is always ready to load, no turning back into position with crank or reverse gears to cause breakage. Apron does not extend below axle. The Combined **HOOD AND END GATE** keeps manure away from beater while loading, prevents choking of beater when starting and acts as a hood and wind shield in spreading. Starts the manure in the right direction, therefore spreads more evenly. **It has a graduating lever and can be regulated to spread thick or thin 8 to 25 loads per acre while in motion. It catches the poor spots with a double dose. LIGHT DRAFT** 1st. Because the load is nearly equally balanced on front and rear wheels. 2nd. The team is as near load as it can work. 3rd. Front and rear axles are same length and wheels track. 4th. Beater shaft runs in a **ball and socket bearing,** therefore no friction. **Beater** is 23 inches in diameter. Has a shipper that **positively** throws machine into and out of gear and holds it there. **STRENGTH AND DURABILITY.** Our machine is made so strong that it is almost impossible to break it. Every piece is made extra strong regardless of cost. Every gear and sprocket wheel is keyed on. We use no pins or cheap contrivance to come loose, get out of order, break and cause trouble. **GUARANTEE.** Should any part break, wear out, or get out of order within one year, we replace free of charge. **LARGE CATALOGUE** 10 by 13 inches, with 8 large cuts shows spreader perfectly and describes it fully. Gives 34 reasons why the **Great Western Endless Apron Manure Spreader** is the best and most complete machine made and why you should have one. Also tells how to apply manure to secure best results. **Mailed free.**

Your Privilege
AND YOUR DUTY.

EVERY normal man is endowded by nature with the power to think, and the man who doesn't use that power is very apt to work for some other fellow's benefit all his life.

The creameryman who sells farm separators and the dairyman who uses a farm separator have the opportunity of knowing absolutely what is the best separator made, and **should know.** It is not only a privilege but a duty that each should thoroughly investigate this matter, think it over and decide for himself. Don't be guided by some other man's prejudice or by some smooth salesman's talk, but examine a **Tubular** separator, then examine other separators and decide.

We don't want you to buy a Tubular until you have examined other separators whose chief recommendation is their cheapness, and that are more cheap in their construction than in price.

When you examine the Tubular notice the low-down supply can, the light, simple, easily cleaned bowl, the strong, solid frame, and the automatic oiling arrangement. Then remember that the **Tubular** is the lightest running separator made, that it skims more exhaustively than any other separator, and that it will always skim beyond its rated capacity. Last of all bear in mind our request that you see the **Tubular**, examine it carefully and let the machine talk for itself.

"ADVERTISEMENT"

VERY FEW PEOPLE

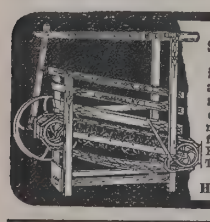
Are Free From Some Form of Indigestion.

Very few people are free from some form of indigestion, but scarcely two will have the same symptoms.

Some suffer most directly after eating, bloating from gas in stomach and bowels, others have heartburn or sour risings, still others have palpitation of heart, headaches, sleeplessness, pains in chest and under shoulder blades, some have extreme nervousness, as in nervous dyspepsia.

But whatever the symptoms may be, the cause in all cases of indigestion is the same, that is, the stomach for some reason fails to properly and promptly digest what is eaten.

This is the whole story of stomach troubles in a nutshell. The stomach must have rest and assistance and Stuart's Dyspepsia Tablets give it both by supplying those natural digestives which every weak stomach lacks, owing to the failure of the peptic glands in the stomach to secrete sufficient acid and pepsin to thoroughly digest and assimilate the food eaten.



One grain of the active principle in Stuart's Dyspepsia Tablets will digest 3,000 grains of meat, eggs or other wholsome food, and this claim has been proven by actual experiment, which anyone can perform for himself in the following manner: Cut a hard boiled egg into very small pieces, as it would be if masticated; place the egg and two or three of the tablets in a bottle or jar containing warm water heated to 98 degrees (the temperature of the body) and keep it at this temperature for three and one-half hours, at the end of which time the egg will be as completely digested as it would have been in the healthy stomach of a hungry boy.

The point of this experiment is that what Stuart's Dyspepsia Tablets will do to the egg in the bottle it will do to the egg or meat in the stomach and nothing else will rest and invigorate the stomach so safely and effectually. Even a little child can take Stuart's Tablets with safety and benefit if its digestion is weak and the thousands of cures accomplished by their regular daily use are easily explained when it is understood that they are composed of vegetable essences, aseptic, pepsin, diastase and Golden Seal, which mingle with the food and digest it thoroughly, giving the overworked stomach a chance to recuperate.

Dieting never cures dyspepsia, neither do pills and cathartic medicines, which simply irritate and inflame the intestines.

When enough food is eaten and promptly digested there will be no constipation, nor in fact will there be disease of any kind because good digestion means good health in every organ.

The merit and success of Stuart's Dyspepsia Tablets are world-wide and they are sold at the moderate price of 50 cents for full sized package in every drug store in the United States and Canada, as well as in Europe.

Instructions to Patrons.

We are always glad to see any movement of creamery companies towards obtaining purer milk, and especially to note attempts in educating the patrons in better care of the milk. Much milk is dirty because the patrons have not had the cash importance of cleanliness brought home to them, and we therefore commend heartily the following circular to patrons:

IT IS IMPORTANT

To keep stables as clean as possible.

To be thoroughly neat and clean in milking.

To thoroughly wash and scald cans and pails.

To strain through good strainers.

To first wash cloth strainers in cold water.

To cool night's milk by setting cans in cool water and stirring it often.

Do not mix the warm morning's milk with the cool night's milk before cooling.

The can covers should be kept off until ready to start for creamery. A cover of wire screen should take its place meantime.

The skimmed milk must be emptied from the cans as soon as it is received at home and cans rinsed with cold water, then scalded and aired.

We cannot handle anything but strictly sweet milk.

It would be convenient for haulers if you would place the cans as near the road or driveway as possible.

Should there be an error or anything you don't understand in dealing with us, call at the office where all mistakes will be corrected. Each and every one of our patrons is invited to call, look though the creamery and inform themselves as to our methods of doing business. We test four times each month. Patrons are always welcome at testing time. Our methods are founded on business principles. We aim to deal honestly and fairly with all.

Thanking you for your patronage and soliciting a continuance of the same we are Yours truly,

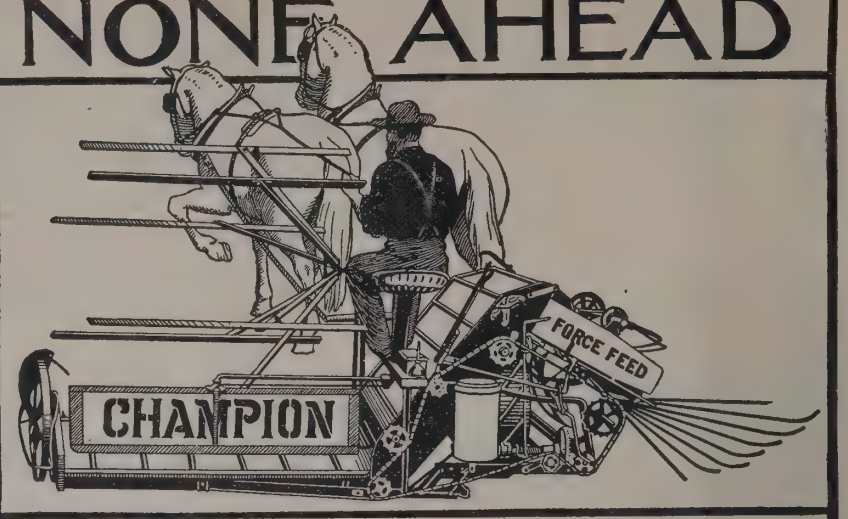
RIVERSIDE BUTTER CO.

Three Rivers, Mich.

Holsteins Recommended for Public Institutions.

The State Board of Control of Minnesota recently summoned the superintendents of the state institutions to consider the advisability of inaugurating a more systematic method of managing the various farms connected with these institutions, and to determine, if possible, the kind of cattle best adapted for them; the proper management of the herd; best methods of rearing the young stock and securing economic milk production. Eleven of the twelve superintendents of state institutions were present and Prof. Haecker, chief of the Dairy Department of the Minnesota Experiment Station, was called upon to advise them. The details in regard to best methods of dairy farming, under the peculiar conditions existing at public institutions were gone over by the Professor, and a critical review given of the characteristics of each breed, physical and temperamental, and the peculiar composition of the milk of each. Taking into consideration the conditions that obtain at such institutions, and the object for which the herds are primarily kept, namely, milk for food, he recommended that the Holstein cow be selected. We are not advised as to the reasons given for this conclusion, but it indicates, at least, that the professor is free from prejudice, since it is well known that he is not recognized as a champion of this particular breed.

It is expected that the outcome of this conference will be the introduction of the breed into all Minnesota public institutions on a type basis, foundation stock to be bred at one or two institutions, and the offspring distributed among the others.



Feeding City Swill to Swine.

ED. HOARD'S DAIRYMAN: In answer to T. N. B. in HOARD'S DAIRYMAN, I never feed city swill to either pigs or chickens unless I am guaranteed no soap in swill. Soap in swill is a very frequent cause of scrofula etc, but more often death. A very little even is very poisonous.

SUBSCRIBER.

B. C.

NONE AHEAD

THERE is no binder ahead of the Champion for strength and durability, besides it has valuable improvements which greatly increase its capacity for handling difficult conditions of grain, and are useful in the usual and ordinary conditions. The most important is the **force feed** elevator which delivers the grain positively but gently to the packing arms where it is made into bundles, and choking in the elevator and waste of grain are prevented. Next is the **eccentric power-giving wheel** on the binding attachment which gives the needle an increase in power of 16 2-3 per cent over the common wheel, and permits the Champion to bind large and tight bundles in the heaviest grain without jerk or strain on the machine or on the team. Write for catalog describing these and other practical improvements on the Champion binder, also on the **Champion mowers** and **Champion hay rakes.** Handsome colored calendar sent free also if requested.

Creamery Patron's Investigation at a Maine Co-operative Creamery.

ED. HOARD'S DAIRYMAN:—Following is a continuation of my report:

No. 51—Farm consists of tillage, 10; pasture, 40; woodland, 25 acres; total area, 150 acres; the orchard of two acres numbers 100 trees; principal crops are potatoes, corn, oats and beans; pasture is permanent; herd consists of 7 cows and 5 other animals; three are registered; breeds are Jersey and Durham; milking period is 10 months; no record of weight or tests of quality of milk are made.

This patron is without a silo; on full feed cows receive 6 pounds per day of a mixture of bran and meal (corn); prices are bran, $1.25; and meal, $1.50 for two bushels; has used cotton seed meal.

Estimated cost of feeding cows annually and of income for cream $25 and $45, respectively; no grain is fed on pasture; pasture season May 20 to October; does not pasture mowing land; has not tried soiling; keeps up herd by raising calves and herd is improving; rations are not balanced by calculations; skim milk is fed to calves and Chester White pigs, of which 6 to 8 are fed annually. Evidently No. 51 has a mowing field of 75 acres not included in tillage.

No. 52—Farm consists of tillage, 30; pasture, 20; woodland 6 acres; an orchard of 2 acres contains 100 trees; crops are potatoes, beans, corn and oats rotated in the order named; pasture is permanent; herd consists of grade Jersey cows, 3; heifers, 2; horses, 3; sheep, 12; and pigs, 2; milking period for cows is 10 months; no records of weight, or tests of quality of milk are made.

This patron has no silo; grain to cows on full feed consists of shorts and meal (corn) of which 4 quarts is a day's feed for a cow; prices are $1.10 and $1.45 per cwt; no cotton seed meal is fed.

Estimated cost of feeeding cows per year, $36, but has never kept account of the income for cream; does not feed grain on pasture, but does pasture mowing fields; pasture season is May 20 to Nov. 15th; never tried soiling; maintains herd partly by raising calves and partly by purchase; considers herd to be improving; does not make calculations to balance rations; considers skim milk worth 25 cents per cwt. to feed calves and Chester and Berkshire pigs, of which 4 are fed per year.

No. 53—Farm consists of tillage, 50; pasture, 25; woodland, 75 acres; an orchard of three acres contains 200 trees; principal crops are corn and potatoes; pasture is permanent; herd consists of Jersey cows, 6; other cattle, 6; cows are registered; milking period is 10 months; no records of weight of milk are kept, but cows have been tested for quality of milk. This patron has a silo; grain mixture for cows consists of corn and cob meal, bran and cotton seed meal; weights fed not stated, but prices are: Bran, $1.30, and cotton seed meal, $1.50 per cwt.; income from cream per cow $50; cost of feeding not given; grain is not fed on pasture, nor are fields pastured; full pasture season, May 20 to September.

This patron feeds his cows on a soiling system September to November; calves are raised to keep up the herd, which is improving by keeping the best for cream; rations for cows are balanced; skim milk is fed to calves and Yorkshire pigs.

No. 54—Farm consists of tillage, 40; pasture, 65; woodland, 10; wasteland, 5 acres; orchard of about 150 trees; principal crop is oats; pasture is permanent. Herd consists of common stock, 3 cows, 2 three-year-olds, 3 two-year-olds, 3 one-year-olds, and 3 calves; milking period is 10 months; no records are kept of weight of milk, nor are tests made of quality.

This patron has no silo; full daily feed of grain per cow consists of 4 quarts wheat bran and 2 quarts corn meal; prices are: Bran, $1.10; meal, $1.45 per cwt.; no cotton seed meal is fed; no grain is fed on pasture; pasture season, last of May to sometime in October; does not pasture mowing and stubble land; has not tried soiling; raises calves and is not improving herd; does not balance rations; feeds skim milk to calves and pigs, of which usually 2 or 3 are kept; does not know value of skim milk.

No. 55—Farm consists of tillage, 150; pasture, 50; woodland, 70; wasteland, 5 acres; orchard of 4 acres contains 100 trees; principal crops are hay, oats and corn; rotation is, hay, 2 years; corn, 1 year; oats, 1 year; seeding for hay again; pasture is permanent. Herd consists usually of registered bull and 10 or 12 cows with 6 or 8 head of others of various ages; breed is Durham; breeds for stock rather than for dairy purposes.

This patron has a silo. Grain feed is oats, corn and shorts; cotton seed meal is used; estimated cost of feeding cows, per year, $37.50; income per cow from cream not given; does not feed grain on pasture; pasture season about May 15 to Oct. 15; mowing fields are pastured a few days when there is a heavy growth; cows are soiled the latter part of summer.

Raise some calves and purchase some cows; herd is improving by using registered bulls; rations are not balanced by calculations, but by judgment; skim milk is fed to calves and Ohio Improved Chester pigs of which between 50 and 60 have been handled the past year.

No. 56—Blank.

No. 57—Farm consists of tillage, 25; pasture, 30; woodland 17 acres; an orchard of 1 acre contains 75 trees; principal crops are oats, corn, beans and potatoes; pasture is permanent; herd consists 9 Jerseys and Herefords, of which 4 are cows and none are registed; milking period is 7 months; no records or tests have been made of milk; but this patron has a silo; cows on full feed receive 4 pounds of shorts per day; price is $1.15 per cwt; when cotton seed meal is fed, one quart per day is allowed.

Cost of feeding and income from cream per cow is estimated at $40 and $55 respectively; no grain is fed on pasture; cows are turned to pasture May 20 to November; mowing fields are pastured about two weeks; no soiling has been tried.

Raises part of the cows required to maintain the herd, which is improving by using good sires; rations are not balanced by calculations; skim milk is valued at 4 cents per gallon or 50 cents per cwt. for calves and pigs; ten to twenty Chester Whites are handled each year.

No. 58—We have only just commenced farming.

No. 59—Farm consists of tillage, 125; pasture, 175; woodland, 100 acres; orchard of 3 acres contains 250 trees; hay and grain are principal crops; pasture is permanent; herd consists of 20 grade Jersey cows; milking period is 10 months; no records of weight or tests of quality are made: this large farm has no silo; grain feed consists of corn meal and bran, the cost of which is $1.45 and $1.25 per cwt.; have used a very little cotton seed meal; cows are pastured May 10th to November, and during latter part of season 4 quarts of bran and corn meal are fed per day per cow; fields are not pastured and cows are soiled; calves are raised to keep up the herd which is improving by introducing new blood (through the sire we are left to suppose F. E. E.) No calculations are made to balance rations.

Skim milk is used to raise calves, poultry, colts and pigs; it is fed sweet; no estimation as to value has been made; three to twenty Berkshires are raised per year.

No. 60—Farm consists of tillage 25, pasture 30, woodland 5 acres; orchard consists of 30 trees; hay, corn and potatoes are the principal crops; no rotation practiced; pasture is permanent; herd consists of Jersey and Durham cows 8, others 1; usually have some young stock; none registered; milking period is 10 months.

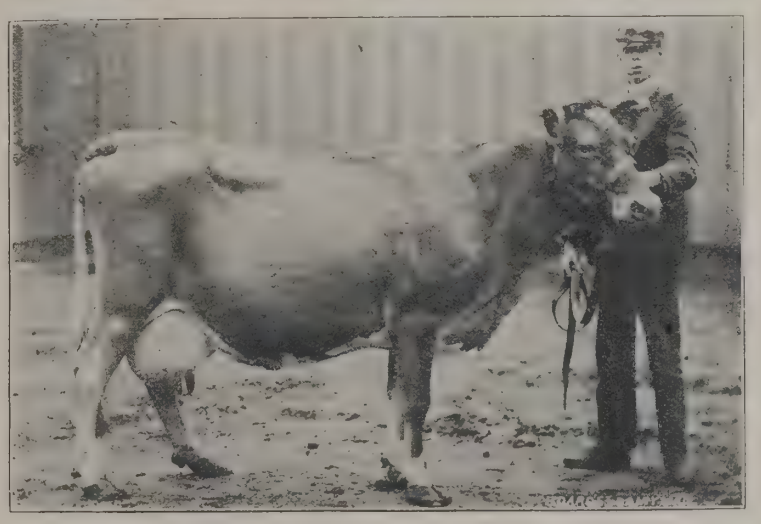
No records of weight or tests of quality of milk are being made; no silo on this patron's farm; full feed consists of 2 quarts per day, and head, of a mixture of meal (corn) cotton seed meal, and bran; the prices of these per bag are $1.40, $1.60 and $1.20 respectively; income per cow, per year for cream is placed at $40; does not feed grain on pasture; pasture season is from last of May to last of October; rarely pasture mowing fields. Use corn fodder and second crop of hay for soiling; raises calves to keep up herd, but fails to tell us whether the herd is improving or not.

This patron needs the help of a spring balance and a Babcock tester, in common with every other farmer who is not using them, for with these he will be sure to compare the records, year by year, of cows with those of their daughters, and to take a new interest in feeding, though his practice seems good—better in summer, perhaps, than in winter; but cows may be fresh in summer and stripping in winter, which makes a difference in the appearance of a ration; skim milk is fed to calves and pigs, of which 6 Chester Whites are fed per year.

No. 61—Farm consists of tillage 75, pasture 70, woodland 185 acres; three acres in orchard include 200 trees; the principal crops are hay, corn and oats; pasture is permanent; the herd consists of 14 cows and 11 other cattle; all being grade Durham; milking period is 10 months; no records of weight or tests of quality of milk are made.

This patron has no silo; on full feed cows receive about 7 pounds corn and five pounds bran. Prices per cwt. are $1.40 and $1.20 respectively; no cotton seed meal is fed; estimated annual cost of feeding a cow and income from cream are $30. and $40.; cows sometimes fed on pasture aud then receive 4 quarts of corn meal and bran; cows are turned to pasture middle of May and come to barn last of October; never have tried soiling; raise calves to keep up the herd which is improving by raising the best calves and using good bulls. Calculations are made to balance rations; skim milk is fed to calves and pigs.

No. 62. Farm consists of tillage 25, pasture 20, woodland 20, orchard 2, and waste land 3 acres. Orchard contains 60 bearing trees; principal crops are hay, oats, corn, potatoes and beans; pasture is permanent, but cows run in one field in fall, this portion of tillage being grazed annually after the crops are removed. Herd consists of 5 mixed bred cows, natives or mongrels and no other cattle; the milking period averages 10 months; no record of weight of milk is kept; when on full feed cows have 5 quarts each per day of a mixture of bran and oat meal (home grown) and cotton seed meal; prices per bag are $1.20, $0.90 and $1.55 respectively; has never estimated cost of feeding cows per year, but income for cream is about $35. Four quarts each per day of wheat bran and oat meal are fed cows on pasture.



Pasture season is May 20 to Nov. 1st. As stated above one field is pastured a little in the fall; cows are soiled in August and September; herd is maintained by purchase and is improving by "purchasing the best cows I can find." No calculations are made to balance rations; skim milk is fed to calves and pigs but no estimate of its value is made; this patron only feeds porkers for home consumption.

Patron No. 62 makes the common mistake in putting dependence on the factory test of fat in cream sent, as showing any valuable fact for him, except to establish his proportional share of each month's earnings in the business; one other point is shown, perhaps, that he skims carefully, for if he ran over more milk the percentage would be lowered, yet without tests he may be leaving some fat on top skim milk for which he could realize more than the extra milk saved is worth at home.

Scab or Itch in Cattle.

Press Bulletin.

Scab or itch, sometimes called mange, of cattle is caused by a minute mite *Psoroptes communis*, var. *bovis* that lives upon the surface of the skin and burrows in the epidermis. It does not attack other animals than cattle, although scab of sheep is caused by a similar parasite.

SYMPTOMS.

Scab or itch does not trouble cattle to any noticeable extent during the grazing season, when they are doing well on grass. Close observation is required to detect the disease in a bunch of cattle, but as soon as they are placed on dry feed, and cold weather sets in, the disease appears and, if the cattle are not doing well, in an aggravated form. Scab usually attacks young cattle, or calves, yearlings and two-year-olds, but may attack cattle of any age if they are "out of condition." The first symptom noticed is an intense itching of the skin, usually in the region of the neck or shoulders. The animals lick themselves, dig at the skin with their teeth or horns, rub against posts or barbed wire, often tearing the skin until it bleeds. The disease gradually spreads along the back, sides, and outside of legs, but does not attack the inside of the leg, thighs, or thin skin of the abdomen. In the early stages the coat looks rough; there is a scurfy condition of the skin; the scurf becomes mixed with a gummy exudate and forms crusts in the hair, sometimes one-half inch thick; the hair then comes off, or is rubbed off the badly affected area, leaving bald patches of thick, calloused, wrinkled skin. These patches often show first and prominently on the top of the neck, as if the neck had been calloused from wearing a yoke, After the hair comes off the parasites leave that part and the hair grows again. Animals suffering from scab present a dejected and debilitated appearance and fall away rapidly in flesh; they do not eat well and spend a great deal of time and energy in scratching themselves.

Scab spreads quite rapidly through a bunch of cattle, especially if the cattle are not doing well. Six or eight weeks after the disease first makes its appearance is sufficient time to disseminate the disease pretty thoroughly. Thrifty, vigorous, animals resist infection longer than others, and recover more quickly under treatment than debilitated animals. The disease is spread by direct contact and by contact with infected posts, feed-racks, walls, etc., against which infected animals have rubbed. The mites will live from a week to ten days in protected places but are killed quickly by direct sunlight.

By scraping off some of the scabs, and especially the epidermis, from the infected part and placing the material in a clean, dry, glass bottle, in a few hours minute white specks, barely visible to the naked eye, can be observed crawling on the inner surface of the bottle. By the aid of a hand lens these mites can be easily recognized.

TREATMENT.

As soon as the disease is discovered in a bunch of cattle, the affected animals should be isolated, and the infected quarters and rubbing posts disinfected with a five per cent solution of carbolic acid.

Affected animals should be well fed and cared for and be salted with a mixture of one pound of flowers of sulphur mixed with ten pounds of common salt. To cure the disease, external treatment must be applied. If a large number of cattle are affected, the most satisfactory method is to build a dipping vat, through which the animals must swim in the dip used to destroy the mites. The vat should be forty feet long. Efficient remedies used for external application are some of the coal tar products, such as car-sul, chloro-naphtholeum, zenoleum, creolin, etc.; these are used in two and one-half per cent solutions with water; that is, one part of the medicine to forty parts of water. A very effective and cheap dip is composed of lime and sulphur in the following proportions:

Flower of sulphur	21 pounds
Uuslaked lime	16¾ "
Water	100 gallons

Slake the lime to form a thick paste, sift in the flowers of sulphur and stir well; put this mixture in a kettle with twenty-five or thirty gallons of water and boil for thirty minutes at least; two hours is better. The chocolate-looking mass is allowed to settle, the clear liquid is drawn off and water enough is added to make one hundred gallons. All dips are more effective when used warm, from 100° to 110° F. Animals should be kept in the dip about two minutes, or until the scabs are thoroughly saturated. A second dipping in two weeks will kill any mites that may have hatched from the egg after the first dipping One dipping, if thoroughly done, is usually sufficient, however, to free a bunch of cattle from this disease.

Where only a few animals are affected, hand treatment can be resorted to, but it should be thoroughly done. The remedies can be applied with scrubbing brushes, cloths or sponges, and all scabs and crusts should be thoroughly saturated. The remedy should be applied warm, as in dipping. In dipping or hand treating warm, sunny days should be selected for treating the animals.

Cattle scab is rather common in some parts of the Great Plains region, and stockmen in purchasing cattle should be cautious about getting animals affected with this disease. While the death loss is usually not high, the loss of flesh, general deterioration and annoyance resulting from this disease is considerable. Cattle that have been treated should be carefully watched for reappearance of the disease, especially when taken off of grass the next season. N. S. MAYO.

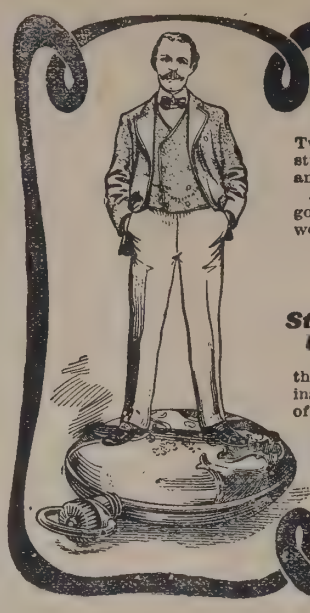
The Dairy Steer.

Every now and then somebody bobs up with a dairy steer that does something wonderful, according to his account, and then some editor who never fed a steer in his life, jumps to the conclusion that dairy cattle are all right as beef producers. If you ever see anything of this kind label it nonsense and let it go at that. Or if you want to learn a valuable lesson get some of these steers, put some high priced corn into them and learn it. There should be no dairy-bred steer; he should go onto the veal market at an early age.—*National Stockman.*

Now if the above be true the following statement is true by the same natural law.



Every now and then somebody bobs up with a beefy (dual-purpose) heifer that does something wonderful, according to his account and then some editor who never milked a heifer in all his life jumps to the conclusion that beef cattle (dual-purpose) are all right as dairy producers. If you see anything of this kind label it nonsense, and let it go at that, or if you want to learn a valuable lesson, get some of these heifers and put some high priced dairy feed into them and learn. There should be no beef bred heifers for dairy work; they should go into the hands of the aforesaid editors. What is sauce for the steer is sauce for his sister, the heifer.

Alfalfa Seed

When can I get (30) lbs of alfalfa seed, as you say that is the proper amount for one acre?

Conneautville Pa. J. C. G.

See ad of John A. Salzer Seed Co. in this issue. It will cost about 10 cents per pound.

STRENGTH

Twenty-five years ago in acquainting jewelers with the strength of the Jas. Boss Stiffened Gold Watch Cases, an enterprising salesman used the method here shown. Jas. Boss Cases are still the strongest cases made. As good as solid gold in appearance. Better than gold in wearing quality. Less than solid gold in cost. In a

JAS. BOSS
Stiffened GOLD Watch Case

there is a layer of very hard composition between an inside and outside layer of solid gold reducing the cost of the case, and adding greatly to its strength. BOSS Cases are guaranteed to wear for 25 years; are recognized as the standard, and sold as such by all jewelers. Write us for a booklet.

Equalizing Cream Tests.

ED. HOARD'S DAIRYMAN:—Sometime ago you published in the DAIRYMAN the method (or description of) employed in the Hoard creameries whereby the cream tests were equalized; that is, when tested with pipette. It was a graduated scale by which additions were made to the Babcook test. I wish you would publish the same again.

We are selling the product of our creamery at "½ cent under Elgin, delivered in Chicago." Is that a fair price for a good product? I can't see why, if our product is all right and we sell to a Chicago house, we should not have Elgin price in Chicago. SUBSCRIBER.

Wis.

If the butter is high grade, we see no reason why he should not receive Elgin prices.

The following table gives the correction to be added to the reading of the Babcock cream test. We would call attention to the fact that this correction is not exact and that weighing the cream samples is by far the best method, even if it does take more time:

Reading by Measure, 17.6 c. c. Pipette.	*Reading Corrected to Nearest Tenth.*	*Reading by Measure, 17.6 c. c. Pipette.*	*Reading Corrected to Nearest Tenth.*
10	10.1	31	32.1
11	11.1	32	33.2
12	12.1	33	34.2
13	13.2	34	35.3
14	14.2	35	36.4
15	15.3	36	37.5
16	16.3	37	38.6
17	17.3	38	39.7
18	18.4	39	40.7
19	19.4	40	41.8
20	20.4	41	43.
21	21.5	42	44.1
22	22.5	43	45.2
23	23.5	44	46.3
24	24.6	45	47.4
25	25.7	46	48 6
26	26.8	47	49.8
27	27.8	48	50.9
28	28.9	49	52.1
29	29.9	50	53.2
30	31		

It is to be noted that the corrections are only applicable to cream that is practically free from air bubbles, and, therefore, cream fresh from the separator, containing more or less air, will show more difference than the table represents. The liability to errors in testing increases with the thickness of the cream. So the corrections are more certain to apply on cream of average thickness or less, than on that containing a larger per cent of fat. If it is desired to test considerable quantities of rather thick cream, as is often the case in factories which are the center of skimming station systems, it is undoubtedly best to depend upon weighing the samples for testing.

Siloing Clover.

ED. HOARD'S DAIRYMAN:—In your paper of a few weeks ago I noticed a question regarding the siloing of clover with a request that some one give their experience.

Last fall our corn crop being almost a failure, we, my father and I, decided to mix clover in with the corn. Accordingly we cut a load of clover just in the blossom to two loads of corn, and in this way filled our two silos. On opening them we found the corners badly burnt for a distance of eight inches, besides eight inches more that was not fit to feed the cattle. The sides were hurt in the same way for about one foot. This is our experience with clover thus far. It seems to me that the trouble lies in the silage not being properly packed, as I believe the silos were in very good condition. We shall try the experiment again this year and try and locate the trouble if possible. The center of the silage was in bright condition and was readily eaten by the cows.

If those who have had experience in this line can give us any information, we should be glad to know it through the columns of this paper. C. W. R.

Newport, Vt.

A Michigan Herd Record.

ED. HOARD'S DAIRYMAN:—I have been interested the past season in the reports of the dairies investigated by HOARD'S DAIRYMAN, and noticed the increase in profits on dairies reported from Holstein localities in the same state. I am inclined to think they are the most profitable for the farmers that patronize a cheese factory and feed the whey to hogs. In Lenawee Co., we have 20 cheese factories, 5 creameries, 1 condensed milk plant and the industry is still growing.

Thinking that others may be interested in milk records as well as myself, will send a record of my herd for the past season, up to Jan. 1.

No.	*Date of Freshening.*	*Lbs.*

Will milk two of the heifers all winter; balance of herd is nearly dry.

Feed for dry cows, bran, shredded fodder and mixed hay. Will give heavier grain shortly before freshening. Don't feed grain during summer. W. G.

Limecreek, Lenawee Co., Mich.

Milking Heifer Calves.

ED. HOARD'S DAIRYMAN:—The "J. A. M." article on page 1080 is certainly very amusing and instructive. We surrender all right and title to heifer breaking to J. A. M., who without dispute has an original method and points of superiority, that entitle him to world-wide attention. To teach calves five months old to give milk avoids a good many serious difficulties in dairying.

"Jam" is standing in the open door of an astonishing discovery in dairying, the originator of a "Jam-ed" breed of calveless cows, as calf bearing will not be necessary to get milk flow. It might be embarrassing to milk a calf with large rudimentaries for several weeks to discover at last that it was a steer calf, but there would be no actual loss, as it would make good beef and in reality the long sought dual-purpose animal, Jam's calveless cows would also possess the invaluable feature of not being susceptible to abortion; calf cholera would be an impossibility and no reason exists why these cows should not be continuous milkers.

These cows if fed Townsend's turnips, Gould's silage and Wing's alfalfa should develop into the *Jamdest* breed of milk producers in existence. DON JOSE.

"ADVERTISEMENT."

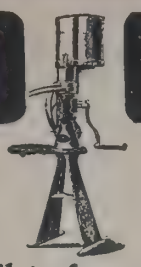
APPETITE COAXING.

Not Necessary When Proper Food is Used.

Coaxing up an appetite is hard work and unnecessary when a little thought is given to scientific feeding.

Fill the stomach with the wrong stuff and it is not long before the palate too is affected and even the sight of food is nauseating. Stomach and nervous ills of all kinds soon come and the body is left without nourishment.

Then take on Grape-Nuts for a few days and see the difference. Eating is no longer a duty but a delight, for the food is made of the proper grains prepared in a natural, scientific manner and the flavor is delicious. The case of a schoolma'am of Cedar Mills, Minn., is interesting. She writes: "I used to go without lunch many a day, not finding it tasty. In consequence I usually had a severe headache before the afternoon session was over, and felt nervous and cross.



"I had almost concluded to give up teaching on this account when a friend induced me to try Grape-Nuts. I will say frankly I did not care for it at first, but tried it two or three times and then found myself beginning to enjoy the crisp, nutty flavor.

"The food has changed the order of my life. I carry it for lunch every day now. The color has come back to my cheeks and lips, and I have no more headaches or nervous spells.

"My body is full of energy and new life, and life seems worth the living, now that I have found the proper food."

Empire Eight Years Empire Fifteen Cows

The Empire Way Makes Cows Pay.

1895 1896 1897 1898 1899 1900 1901 1902

How's This for a Record?

Emporia, Kans., Jan. 2nd, 1903.

Empire Cream Separator Co., Bloomfield, N. J.

Dear Sirs: Have used one of your **Empire** Cream Separators for the past eight years, during which time I have been milking at all times from twelve to fifteen cows. The cost for repairs in the eight years has been only seventy-five cents. I have had experience with other separators but consider the **Empire** superior to any other, as it never caused me any bother. It is easy to clean and has proven very durable. It does good work at all times. L. H. VAHSHOLTZ, Rural Route No. 4.

The Empire Cream Separator turns more easily, is more easily cleaned, does better work, and costs less for repairs than any other, because it is the **simplest separator made.** Don't buy a separator until you have investigated the merits of the Empire.

Send for our new book on Making Milch Cows Pay.

Empire Cream Separator Co., Bloomfield, N. J.

Western Office—FISHER BUILDING, CHICAGO.

Eight Years 75 cents for Repairs Fifteen Cows

Some People

do not see the necessity for two wheels on a hoe. They like a Single Wheel Hoe because it is a trifle lighter than the Double, and it does not cost quite so much. To meet this demand we make the

No. 16 "Planet Jr." Single Wheel Hoe Cultivator, etc.

It is our latest 1903 model of this tool and is a decided improvement on anything of its kind we have heretofore offered. It is provided with two hoes for working middles or both sides at once, throwing dirt to or from the rows; three cultivator teeth for working middles; two rakes for pulverizing and smoothing, and a plow which is also an excellent furrow opener. Handles are adjustable to fit short

Planet Jr.

or tall workmen or children. All attachments are quickly and easily changed. It will work any garden crop planted in rows and one person can do more and better work with it than six men can do with hand hoes. Should you need a horse tool you will find the **No. 8 "Planet Jr." Horse Hoe, etc.,** shown below to be the best in existence.

These are but two of our fifty seeding and cultivating implements, including plain and combined Seed Sowers, Wheel Hoes, Hand Cultivators, Walking Cultivators, One and Two-Horse Riding Cultivators, Special Sugar Beet Tools, etc. Our new 1903 catalogue is educating. It contains over 100 illustrations with full descriptions and prices. It costs you nothing and will make you money. Write for it.

WILL IT PAY YOU TO TAKE HOARD'S DAIRYMAN?

W. H. Jenkins took a census in 1901 of 50 farmers who were patrons of the creamery in Montrose, Pa. Twenty-five of them read dairy papers; twenty-five did not. The twenty-five who did read dairy papers averaged $50.23 per cow for the year. The twenty-five who did not read averaged $32.95. Here is a difference of $17.28 per cow. Did it pay the twenty-five to read? Did it pay the other twenty-five not to read? That's not all. Those who did read averaged a profit over cost of food of $15.06 per cow. Those who did not read averaged a profit of 66 cents. Is not that dairy farmer standing greatly in his own light who will not pay 2 cents a week for Hoard's Dairyman? These are hard facts worth thinking over.

Coming Events.

Wisconsin Buttermaker's Association, Waukesha, Wis., Feb. 24-26, 1903.
Texas Dairymen's Convention, College Station, July, 1903

We are receiving of late a good many requests for a bundle of copies of HOARD'S DAIRYMAN for distribution. We are very glad to forward copies for distribution, for we need the help of every reader to increase the circulation of the DAIRYMAN. Get up a club of subscribers among your neighbors. If there is going to be a meeting of the creamery or cheese factory patrons, write us for a bundle of sample copies for distribution. If you are going to a farmers' institute, have some copies with you. These meetings afford excellent opportunity to work up a good club. Write us at least a week ahead of the meeting saying how many copies you want and we will promptly forward. Give us your help.

WE have received from The MacMillan Co. a copy of Irrigation Institutions by Elwood Mead. The book is a very full discussion of the economic and legal questions created by the growth of irgated agriculture in the west, and is a very timely publication in view of the present agitation of national aid and control of irrigation in the semi-arid states. It takes up land laws, doctrines of appropriation, contract water-rights, duty and measurement of water, and irrigation in the various states where the water question has become of vital importance. It is a most timely and valuable book.

A PENNY SAVED IS TWO PENNIES EARNED.

It would seem that only a few farmers are good reasoners on economical milk production. The great mass of them are making milk just as expensively as it ever was done. The only way to economize that they know of, is to feed less. In 1901, thousands upon thousands of cow keepers half starved their cows and thus in many instances injured them greatly for years to come. The only way they could see to reduce expense, was to take it out of the cows. HOARD'S DAIRYMAN had been talking to those farmers for years about the great economy of the silo but it went into one ear and out of the other. They called that "book farming." Thousands of them are unconvinced yet. They will cut a ton or ton and a half of hay to the acre when they could cut 12 to 15 tons of ensilage having an actual feeding value of six tons to seven of their hay, and still they cannot see it.

Then comes the alfalfa question. The HOARD'S DAIRYMAN farm, with its 130 tons of fine alfalfa hay cut from 17 acres of ground last season and its two silos, has neighbors who don't believe a word in this talk about the great economic valne of the silo and alfalfa. It is a great comfort to some farmers not to believe. Hay is worth $10 a ton in Fort Atkinson. The six horses on the DAIRYMAN farm are being fed on cut corn stalks worth only $2.50 per ton. We have a great abundance of stalks, and the horses can easily spend a part of their time running the tread power. Two tons of good cut corn stalks are eqnal to a ton of timothy hay. There is $5.00 saved by feeding cut corn stalks. Besides. the horses look better, feel better, and cough less then when fed on hay. In the South "corn blades" are counted the finest of food for race horses.

Again, the combination of good juicy corn ensilage, 35 pounds, and 10 pounds of alfalfa hay is the finest thing we ever struck as a milk producer. It requires only about 3 pounds of bran a day to to keep the cows up to their maximum flow. The herd is averaging over a pound of butter fat a day, 17 of them being two and three year old heifers.

Here is the daily cost of the ration:

10 lbs. cut corn stalks at	$2.50 per ton	....	1.25 cents
35 " corn ensilage at	$2.00 per ton	....	3.5 "
10 " alfalfa hay	$10.00 "	"	....5 "
3 " bran	$15.00 "	"	....2.25 "
			12 cents.

For this we are getting, as said above, a pound of butter fat a day. We are now milking 36 cows, 30 of them calved last fall and in December. This pound of butter fat is worth today 29 cents. These figures will show the great economy of putting together two such full elements as succulent corn ensilage, and good alfalfa hay. And yet the unbelievers will hang on to their expensive, wastefull ways of feeding, and say they are doing just as well as anybody. What an uncomfortable jolt it would give some of these men if they should read and figure themselves out of their old rut.

Wisconsin Dairymen's Association Annual Meeting.

The energetic little city of Fond du Lac proved itself worthy of its opportunity when it welcomed the Wisconsin State Dairymen's Association within its gates, and by its enthusiastic efforts in making the delegates comfortable and its hearty attendance upon the sessions bore out the statement of its Mayor that though lately asleep, the city is now fully awake and in the thick of the hustle and bustle that befit an up-to-date Western town.

The thirty-first meeting of the Association was called to order by President Emery Wednesday morning, Feb. 11th, and during the exchange of congratulations, between the genial Mayor, Dr. Bishop, and various of the older members of the Association, many incidents of its early life were related, and many names mentioned which have had in the past potent influence in the up-building of this very strong and effective Association.

Uncle Stephen Favill and Ex-Gov. Hoard were the only gentlemen present who could carry their memories back to the very inception of the organization, and they recalled many interesting details of the first meeting at Watertown in 1872.

The real business of the meeting was put in motion by the reading of the President's Annual Address. President J. Q. Emery, of Albion, briefly reviewed the history of the Association and compared the conditions in the state of Wisconsin with reference to dairy matters as existing at that date with those existing to-day.

Basing an estimate upon the United States census for 1900, the revenue from the dairy industry of the state for 1902 reached at least $55,000,000, having increased within a decade one hundred and ninety per cent. Wisconsin stands third only in the list as a butter-producing state, while she leads the whole country in the manufacture of cheese.

In 1902 there were 2,697 cheese and butter factories in Wisconsin as compared with forty cheese factories and no creameries in the year 1872.

This organization not only brought into being, but has been a loving mother to the dairy school at Madison and to the Agricultural College with its many branches and opportunities; the Babcock test is one of the family of the Dairy Association; also the Dairy and Food Commission, and last but perhaps not least, the Farmers' Institutes.

The President, however, vigorously disowned for the Association any relationship with that creature which has been such a disgrace to the dairy family, viz.: oleomargarine, and closed his report by appealing to the members of the Association for help and influence in the establishment of the rural schools.

Secretary Burchard realized that this was a good time to bring forward some resolutions along the line suggested by the President and such were unanimously adopted. Among these was included a resolution directed against renovated, clarified and rechurned butter; another resolution approving the action of Congress and of the Secretary of Agriculture relating to the manufacture and sale of renovated butter, and heartily endorsing the bill now pending in the state legislature to promote the efficiency of the Dairy and Food Commission and requesting all judges, magistrates and prosecuting officers to assist the Dairy and Food Commissioner in enforcing the law relating to the sale of oleomargarine.

Mr. C. P. Goodrich, of Fort Atkinson, gave a most interesting and instructive history of his work in taking a cow census in Fond du Lac county. In such work he visited forty-eight creamery patrons and twelve cheese factory patrons; he ascertained the average number of cows milked in the whole district; he arrived, as nearly as possible, at the kinds and amounts of the different feeds given the cows and the value of such feed, and with this data, he made up a chart, giving all these details with reference to each particular herd, arriving at the average cost of feed per cow, which was $29.88; the average returns for butter from the creamery per cow, $35.82, and many other details, showing an average profit all through of $14.34, not counting calves or manure or labor. Some very interesting comparisons between different herds, showing astonishing differences, were made by Mr. Goodrich, but this chart has already appeared in your paper, and can be studied at leisure by your readers. Mr. Goodrich referred with considerable feeling to a letter lately received by him from a gentleman who was shown in the cow census reported by Mr. Goodrich last year to have been running his herd almost without profit. The young man took the lesson to heart and by weeding out unprofitable cows and adopting better methods, was able to report to Mr. Goodrich a very material improvement in the financial result of the year's work.

The evening session of Wednesday included an address on "Home Making", by Mrs. Adda F. Howie, and another by Rev. Sabin Halsey on The Clergyman as a Farmer and an interesting programme of music and readings.

The two cheese instructors employed by the Dairymen's Association to visit factories and suggest improvements, tendered their reports at the first session on Thursday morning, and these two young men, Mr. E. L. Aderhold and John B. McCready, showed in the reports read an ample justification for the expense incurred in their work and crying necessity for more expense of the same kind.

Most of the readers of HOARD'S DAIRYMAN have heard about the beautiful calves and very profitable cows that are fortunate enough to be housed in the cheery barns of the Sunny Peak Farm.

Mr. D. W. Howie Jr., of Elm Grove, read a paper in which the detail of each day's work was laid before those present, and the intelligent enthusiasm and careful attention put into that daily labor will go far toward explaining the very satisfactory results.

The veteran dairyman of Illinois, Mr. H. B. Gurler, of DeKalb, has a more than national reputation in dairy matters, and the lessons that he extracted from the annual records of sixty cows in one stable made a fine supplement to Mr. Goodrich's study of nearly as many herds. Mr. Gurler is an enthusiastic feeder of ensilage, but he is looking forward anxiously to the time when he can grow plenty of alfalfa in Illinois, even if he has to import a carload of inoculated soil from some other state, as he believes that alfalfa will be the cheapest and, next to ensilage, the most reliable feed he can depend upon.

A banquet, followed by a half dozen responses to toasts, with ex-Gov. W. D. Hoard, presiding as Toast Master, or, as he put it, "Milk Toast Master," will not soon be forgotten by the citizens of Fond du Lac, and others who were privileged to be present.

Friday, February 13th, was a day filled full of good things.

Mr. U. S. Baer, writing as one who knows that of which he speaks, told a few of the things needed in the Wisconsin cheese industry. He started out with the proposition that the introduction of Babcock test for fat and the Wisconsin curd test, the recent experiments in curing cheese at low temperature, and the requirements of the markets for a higher grade of excellence in cheese, have created a crying need for more highly educated cheese makers. These gentlemen must not only be good cheese makers, with a high appreciation of cleanliness, a thorough knowledge of apparatus and a trained ability on the financial side of the business, but they must be capable of teaching the farmer improved methods of handling stock, in feeding and otherwise; they must be able to take a Babcock test outfit into a neighborhood, gather the farmers together and make them understand and become interested in testing their animals and caring for them properly. They must have the backbone to turn away milk, if it is necessary, in order to save disaster in the manufacture of the product, and all this must be done in hearty co-operation with other cheese makers. Mr. Baer deplores the large number of small and inadequately equipped cheese factories in contiguous territory, and urges that every factory be equipped with a steam boiler, knife mills and automatic curd agitators. Mr. Baer thinks that there should be a law under which cheese makers shall be licensed, and only those who have had two or more years' experience as helpers should be permitted to manage a factory, and he also believes that as a protection to the public the cheese factories themselves should be under the supervision of a licensing body.

Mr. James G. Moore, following up the work heretofore done by the younger Mr. Goodrich, has been in the field during the past year acting as instructor in the creamery line of dairy work, going from creamery to creamery under the auspices of the of the Dairy Association. His experience has taught him that such work could be much more effectually done if the instructor could be clothed with powers similar to those of the Minnesota State Dairy and Food Commissioners, which permit of the fining of the owners of unclean cans, and also of improperly cared for pumps, pipes, and other portions of the factory. He suggests that there should be a legal standard of overrun and a more uniform system of dividend statements, as there is in many cases obviously fraudulent use made of this factor in order to draw patronage from one factory to another. Mr. Moore echoes the cry of the cheese instructors, that more instructors are absolutely necessary, as it is manifestly impossible for one man to look after eleven hundred creameries in a state as large as Wisconsin. More than this, the instructor should be able to go among the farmers themselves and assist them toward a better care and production of milk.

Mr. Charles L. Hill, of Rosendale, in an address on the subject of "Dairy Bulls," tried to answer the question so often asked him: "How can I be reasonably sure that any bull that you or any other breeder may send me, will improve

the quality of my herd?" Mr. Hill acknowledges his inability to give a direct answer to the question, but is willing to discuss the matter, and give what suggestions occur to him out of a considerable experience, and these are some of the principal points suggested by him:

First and most important, choose the breed you take a fancy to, because you will naturally give it the best care and thus achieve the best success. In seeking a bull, particularly if that is done by correspondence, the dairyman must rely largely on pedigree and the reliability of the breeder he deals with. A very important point is, if possible, to see the dam of the bull, which, according to Mr. Hill, should make at least four hundred pounds of butter in a year. An old bull, if still vigorous, is valuable, because he has proved what he can do.

The first point to be looked for in the selection of a bull would be masculinity, not necessarily coarseness, but having a resolute, sturdy, commanding appearance, showing that he has energy to spare. He should have a good muzzle, showing good appetite, and a large barrel, showing good digestive capacity, even if the barrel has caused his back to sag a little. If possible, see that his dam had a good shaped udder, and the bull himself good sized, squarely placed rudimentary teats. Let him be thin in the thighs and show no tendency to beefiness anywhere.

This bull should be fed a little grain ration, all the good hay or corn fodder he wants, but not much corn silage. A very important thing is that he have plenty of exercise daily, and by far the cheapest and best way to exercise a bull is in a tread power, where, by working an hour each day, he can easily earn his board. Care should be taken that the power is not steep or he will slip. An important item in the care of a bull is to keep his hoofs sawed off. He should have a ring in his nose about the time he is a year old, and always be handled by a staff. A daily grooming is a good thing. Do not abuse your bull, but still be firm with him. Never fool or play with a young bull, but always make him mind, and then as he grows older, never give him a chance to know he can do anything else, and never forget that it is always the gentle bull that kills the man. Our most successful dairymen agree that more than any thing else their success lies in the continued use of the best pure bred dairy sires they could find. Therefore, in the words of the revered Hiram Smith: "Buy a bull."

Another visitor from the adjacent state of Illinois was welcomed by the Association in the person of Mr. Euclid N. Cobb (known in your columns as Buff Jersey). This gentleman runs a private Agricultural University, and each one of his ten children occupies a chair in said university, and Mr. Cobb told how they do it in this infant industry; how the oldest boy is the foreman of the farm, having charge of the barns, the horses, the field work, etc.; the second looks after the dairy animals; the second girl is responsible for the attractive butter packages, which with the assistance of her younger sister, are prepared for market each day; and so on down to the youngest, each has his work to do, each is paid for his work and as the work is interchangeable at times, the good work of education goes on.

The reports of the Secretary and Treasurer showing the detail work of the year were submitted and received.

Then followed the report of the nominating committee, recommending that the present incumbents succeed themselves as officers of the Association for the coming year. The report was unanimously adopted and thereby Mr. J. Q. Emery, of Albion, re-elected as President, G. W. Burchard, of Fort Atkinson, as Secretary, and Mr. H. K. Loomis, of Sheboygan Falls, as Treasurer.

The committee on resolutions also made its report and offered a number of resolutions thanking the citizens of Fond-du Lac for their hospitality and helpful interest; the railroads for their courtesies; also thanking the officers.

Another resolution offered by Mr. Foster was adopted as follows. "Be it resolved by this Convention of the State Dairymen's Association that we approve of and request that the appropriation asked for by the Agricultural College Management this year from the legislature, be granted in full as being to the best interests of the whole people of the state of Wisconsin." And the Secretary was instructed to forward copies of the same to the President of the Senate and the Speaker of the Assembly.

A glowing account of the dairy possibilities in Northern Wisconsin was given by Mr. Fred Rietbrock, of Milwaukee, whose experience of many years in developing farm lands in Northern Wisconsin would seem to indicate that he knows whereof he speaks. The climate, soil, water, railroad facilities and the class of population already seeking homes and farms in Northern Wisconsin, would certainly seem to give promise that Mr. Rietrock's prediction will be fulfilled, namely: that within twenty-five years the vast reaches of timber land now contained in what is known as Northern Wisconsin will be as thickly populated, perhaps more so, as the more southern part of the state.

The last paper of the session was given by Prof. W. A. Henry, Dean of the Agricultural College, Madison, on "The Wisconsin Feeding Stuffs Law and Its Importance to the Farmer."

This law was formulated by Secretary Burchard and was passed in 1901, and requires every manufacturer before he can sell or offer for sale any "concentrated commercial feeding stuffs to file with the director of the Wisconsin Agricultural Experiment Station a printed statement giving the name of the manufacturer, the contents of the car or package, and stating the percentage of total crude protein or crude fat contained in such manufacture.

Also that the manufacturer shall pay an annual licence fee of $25 for each distinct brand of feeding stuffs sold in the state, which money shall be used in defraying the expenses incident to analysis and supervision of the business by the Station."

The Station shall analyze a sample of each licensed feeding stuff and if adulteration is found, the manufacturer or dealer shall be subject to a fine."

The object of this law is to protect the farmers against the many adulterations which have been put on the market and delivered to the farmers under many names, all comprehended in the term concentrated commercial feeding stuffs, such as linseed meal, cotton seed meal, pea meal, gluten meals, oil meals of all kinds etc. One very common method of adulteration is by the addition of large quantities of weed seeds, also oat hulls and other by-products from the oat meal factories, which are much lower in feeding value than they purport to be. Light oats are also mixed with corn and sold as ground corn and oats. More adulteration is found in what are called mixed feeds than in oil meal, bran and middlings.

Every farmer should have his name on the mailing list of the Wisconsin Experiment Station and he will then receive its frequent bulletins on this subject. He should be suspicious of feeding stuffs with high-sounding names sold at low prices.

With the discussiom of Prof. Henry's address, closed the Thirty-first Annual Meeting of the Wisconsin Dairymen's Association, and as one of the older members expressed it, he would have said it was the best convention they ever held had he not remembered that he had felt that way about many preceding meetings.

In addition to the foregoing there were seven entries that scored less than 91 points, but in some cases at least the butter exhibited either lost flavor in transit or was not up to their average make in quality. The average score for all the entries, 32 in number, was 93.22 points, which is better than winter exhibits usually make, especially when dairy and creamery butter is all put into one class, as has been the rule in Wisconsin for two years.

DON'T PUT OFF

Seeing your friends and having them join in for a good club of subscribers.

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condense the questions into plain specific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

Contents of Silo—Cement for Sides.

Please inform me capacity in tons of ensilage (corn) of a silo 28 feet in dimeter and in height 30 feet. If plastered inside what should plaster consist of to stand the acid. N. C. S.

Chica,o Ill.

A silo of the above dimensions should contain 370 tons if filled to the top and well packed down. For plastering the inside a good quality of cement should be used with a dove-tailed lath.

Four Per Cent Milk Wanted from Holstein-Friesian Cows.

I have been a reader of your paper for several years. I am now starting a herd of Holstein-Friesian cows; I want a young bull to head my herd, would like to know through your question column what the best butter fat strain is that gives the largest flow of milk. I don't want less than 4 per cent.

Please give me a feed ration of sugar corn fodder, yellow corn fodder, wheat bran, old process oil cake meal, cotton seed meal, mangel wurtzel beets. S. F. S. Jr.

Middletown, Del.

If we had the records of all the Holstein-Friesian cows in America, and the time to study and tabulate them, exhaustively, we might be able to answer our correspondent's inquiry with some degree of satisfaction to ourselves and with a certainty of provoking dissatisfaction with every owner of Holsteins not belonging to the particular "strain" named. But we do not have such records and they cannot be obtained. Moreover every year, and almost every day brings forward new candidates for favor. The better way for this inquirer to pursue is to insert a short advertisement stating what he wants and inviting correspondence from breeders who think they can meet his requirements.

If the roughage mentioned is literally "corn fodder" and not simply corn stover (corn stalks), we advise him to feed, say, 25 lbs. mangels, 4 lbs. bran, 2 lbs. cotton seed meal, and all the fodder the cows will eat Give half of the mangels, bran and meal, with a teaspoonful of salt at night, and the other half with salt in the morning.

Silage and Tuberculosis.

One of our Wisconsin readers is somewhat exercised because his neighbors tell him that feeding stock from silos is liable to produce tuberculosis or some kindred disease. He has used the silo for two years and is well satisfied with it.

The present writer may say that he has used the silo for twelve years, and the longer he uses it the better he is satisfied with it. Notwithstanding the claims of this man's neighbors and others, we can state with confidence that good silage is a perfectly healthful food, both for stock and for those who may use the milk from cows fed on silage, and there is, therefore, no reason in the world for him or anyone else to abandon the use of the silo.

Whey for Calves.

F. T., Niles, Mich., asks us to tell him how cheess factory patrons in Wisconsin raise their calves, using whey instead of separator skim milk.

We are not particularly advised as to the specific practices followed, but possibly satisfactory results may be obtained by using whey and linseed oil meal or dried blood to supply the protein and fat which have been taken from the milk and converted into cheese. Whey has only about one.third the feeding value of skim milk, but one should not attempt to make up this deficiency by feeding whey in larger amounts than they would feed skim milk. Wean the calf from whole milk to whey very gradually and be very careful not to overfeed. Whey should be fresh and comparatively sweet and all vessels used in holding it or feeding it should be cleaned and scalded daily. It is hardly practicable in any case to specify the amount of whey to be fed or the amount of oil meal to be added. The feeder must exercise his own judgment, watching results carefully from day to day, at first making the oil meal into jelly to mix with the whey. As the calf grows older the oil meal or dried blood may be stirred into the whey and at a very early age the calf may be taught to eat unground oats, a small handful every day.

On the remaining questions submitted this inquirer should correspond with Prof. U. S. Baer, Madison, Wis., Secretary of the Wisconsin Cheesemakers Association.

A Pennsylvania Ration.

Please make me a daily balanced ration for my dairy. I am milking 17 cows, large in size, mixed stock; made 5,500 quarts last mon h; all fresh last fall but two; they came in last April. I have plenty of fodder, timothy hay, millet, cob meal, $17.15; wheat brah, $20 a ton; grains, $21 a ton; sprouts, $19 a ton. I feed a mixture of all on cut fodder, three times daily, and all the hay and millet they will eat, without waste. Kindly form me a daily ration. J. T. M.

Paoli, Pa.

If our inquirer is feeding an average of 8 lbs. of corn stover, 7 lbs. of millet hay, 7 lbs. of timothy hay, and 8 lbs. of grain mixture (made up of equal parts by weight from the feeds named) his cattle are receiving 24½ lbs. of dry matter, which contains 1.72 lbs. of digestible protein, 11.75 of digestible carbohydrates and .51 of a pound of digestible fat. His cows are yielding about 23 lbs. of milk each per day and it would seem that the ration as above is adequate to enable them to hold up to this amount provided digestion is perfect. We incline to the opinion, however, that the addition of 1 lb. of linseed oil meal daily, if not materially increasing the present flow of milk, would have a tendency to delay the natural shrinkage incident to advancing lactation.

A South Dakota Feeding Problem.

C. W. H., of South Dakota, writes that he has plenty of speltz (emmer) that is worth 75 cents per hundred pounds; oats, 25 cents per bushel and corn fodder and millet hay. At the present time he is feeding about 10 lbs. of ground speltz and bran with what millet hay the cows will clean up twice a day, and at noon some corn stalks and some stalks with the corn on. He asks whether he can make a ration of speltz, oats and rye, or corn, with millet hay and corn stalks for roughage, without buying bran at $15 per ton.

Very likely a satisfactory ration could be made as stated, but in our judgment it would be cheaper to use some bran. Speltz has about the same feeding value as oats, and it is a question whether he can do better than to continue feeding about as he has been doing heretofore. Corn and oats mixed in equal parts by weight and ground would make a very good combination, but would probably be somewhat more expensive than to use bran in place of the oats.

A Pennsylvania Ration.

Please make up a balanced ration of the following feeds for a herd of 19 Jersey grades, mostly fresh in fall: Wheat bran (winter), $21 per ton; sugar feed, $17.50; gluten meal, $26; cotton seed meal, $28; corn, 55 cents per bushel; oats, 32 cents per bushel; corn fodder and mixed clover and timothy hay. E. S. C.
Chester Co., Pa.

The following combination from the feeds named will afford a fairly satisfactory average ration for this herd of cows. We have not included the "sugar feed" for the reason that we can find no satisfactory analysis of it. It is not mentioned in Henry's book on Feeds and Feeding nor in the latest report of the Massachusetts Experiment Station. If this inquirer's experience justifies its use, of course it can be used to take the place of some of the grains mentioned. Also, if obtainable, it would be very desirable, we think, to have some linseed oil meal, say 1 lb. of it in place of 1 lb. of gluten meal or 2 lbs. in place of 2 lbs. of gluten meal. The expense will be somewhat increased, but we think the resulting yield will more than compensate for the additional cost:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates	Ether Extract
12 lbs. hay	10.24	.58	4.75	.19
10 lbs. corn stover	5.95	.17	3.24	.07
2 lbs. gluten meal	1.76	.64	.82	.05
3 lbs. corn	2.67	.24	2.00	.13
3 lbs. oats	2.67	.28	1.42	.13
Totals	23.29	1 91	12.23	.57

A Wisconsin Ration.

Will you kindly form me a balanced ration of the following feed for cows weighing about 900 lbs. all fresh this winter.

Have for roughage good ensilage with considerable of ears in it; timothy hay worth $8, per ton; corn stover; bran, $18, per ton; oats 30 cts, per bu; corn, 40 cents; oil meal $1.50, per 100 lbs. Will it pay to sell oats and buy bran at $18 per ton?
Elk Mound, Wis. O, W.

It is about an even thing whether to feed the oats or exchange them for bran at the prices named. Our inclination would be to use the oats and we submit the following formula as furnishing a ration that ought to enable these cows to do fairly well.

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates	Ether Extract
30 lbs. silage	7.92	.39	4.20	.21
5 lbs. timothy	4.34	.14	2.17	.07
7 lbs. stover	4.16	.12	2.27	.05
4 lbs. oats	3.56	.37	1.89	.17
4 lbs. corn	3.56	.32	2.67	.17
1 lb. oil meal	.91	.29	.33	.07
Totals	24.45	1.63	13.53	.74

Buckwheat By-product and Churning.

Am feedi g my milk cows ensilage with buckwheat middlings and a little bran, Buckwheat hulls and all ground together. Besides this the cows have some hay. Do you consider this a good diet and as good as corn meal and bran? My dairyman claims it takes him much longer to churn with the feed I am now using than when I fed corn meal and bran on the ensilage. Please give me your opinion in the premises. C. L. G.
W. Hickory, Pa.

This is the second report that has come to us recently about trouble in churning, when buckwheat by-products formed a part of the ration. Probably there may be some reason for this, and we suggest if the use of this by-product is continued that they try churning at a higher temperature, say first at 65 degrees, and if this is not satisfactory, going up to 70 degrees, the temperature for churning when considerable cotton seed is fed.

But we do not think our friend should continue the use of these buckwheat by-products. Buckwheat bran, which is a combination of the hulls and middlings, is much less valuable than ground corn. This buckwheat bran has only 42 feeding units in 100 lbs., whereas corn has 84. We, therefore, suggest that he feed, say, 40 lbs. of silage, 7 lbs. of timothy hay and 5 lbs. each bran and ground corn. If buckwheat middlings could be had, separate from the ground hulls, we would recommend 4 lbs. of the bran and 4 lbs. of the middlings.

A Pertinent Tennessee Feeding Inquiry.

Please formulate me a ration of the following: cotton seed hulls, at $6 a ton; cotton seed meal, $23; bran, $19, and malt sprouts, corn hearts and cotton seed meal mixed at $20, per ton.

Have no silo but intend to build one in time for the coming winter. Winter is mild and cows can be turned on pasture except when raining.

Cows in all periods of lactation. Would you advise feeding some clover hay at $18 a ton to fresh cows instead of all cotton seed hulls?

I am a new hand at the business and in need of all the information. C. W. Y.
Hite, Tenn.

A cow confined exclusively to cotton seed hulls for roughage must have a pretty hard time of it. Although clover hay at $18 per ton is pretty expensive feed we think it would pay this inquirer to use at least 5 lbs. per day. Not knowing the proportions in which the malt sprouts, corn hearts and cotton seed meal are used in the mixture we cannot advise its use, although it may be a very satisfactory feed. We suggest, therefore, that this new hand at the business try an average daily allowance for his cows of 5 lbs. of clover hay, 6 lbs. of bran, 2. lbs. of cotton seed meal and all the cotton seed hulls the cows may care to eat, not omitting salt every day.

Whitwash Pumps.

Could you give me some information in regard to using a force pump with a spray nozzle for applying whitewash to buildings. Does it give good satisfaction? E. H. Jr.
Frederick City, Md.

The whitewash for use with a pump must be made of the usual thickness and then strained through a fine seive so as to remove all grit. Deming and Co. of Salem, Ohio, manufacture nozzles and pumps for this purpose. They give excellent satisfaction, especially on rough wood and in places where a brush cannot be used.

Wages of Butter Maker.

A young man at Carthage, Ill., asks what wages are paid to expert butter makers in this state and whether there is much demand for that kind of work. His motive for submitting this inquiry is stated to be, that he is thinking of going to the state college to learn butter making, and would like to know what wages he may expect after having become proficient.

Of course, wages in this line of work vary, as they do in all other lines of work,

"ADVERTISEMENT."

You Must Get the Book.

You who are sick and are waiting—you must get my book.

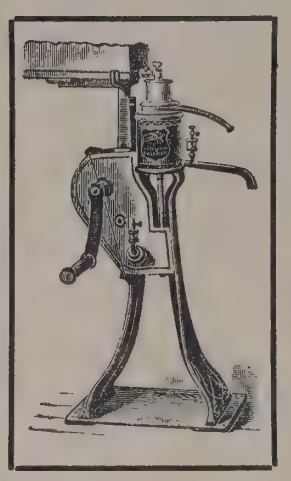
Must, if you hope to get well; for I know that these diseases, when chronic, are seldom cured in common ways.

Must is a strong word, but its true. You will know soon or late that a permanent cure demands my help.

I will mail you an order—good at any drug store—for six bottles Dr. Shoop's Restorative. You may take it a month on trial. If it succeeds, the cost is $5.50. If it fails, I will pay the druggist myself—and your mere word shall decide it.

No other physician ever made such an offer. No other remedy could stand such a test. For your own sake, don't neglect it, when you risk not a penny, and success means health.

I have spent a lifetime in learning how to strengthen weak inside nerves. My Restorative brings back that power which alone operates the vital organs. I treat a weak organ as I would a weak engine, by giving it the power to act. My way always succeeds, save when a cause like cancer makes a cure impossible. And most of these chronic diseases cannot be cured without it.



You'll know this when you read my book.

Simply state which book you want, and address Dr. Shoop, Box 934, Racine, Wis.

Book No. 1 on Dyspepsia.
Book No. 2 on the Heart.
Book No. 3 on the Kidneys.
Book No. 4 for Women.
Book No. 5 for Men (sealed)
Book No. 6 on Rheumatism.

Mild cases, not chronic, are often cured by one or two bottles. At all druggists.

and save 15 to 40 per cent on everything you use. It can be done. Over 375,000 wide-awake, careful buyers sent us their orders last month and got high-grade, honest merchandise—the kind it pays to buy—at a big saving over usual prices. They were the people who knew the value of a dollar saved. You, too, can do it. A FEW SPECIMEN VALUES are here shown, selected from our 1100-page catalogue, which contains pictures and prices on 70,000 articles of everyday use.

MORRIS CHAIR

Made of golden oak or in mahogany or weathered oak finish. Massive, heavy carved and well-finished frame; reversible cushions covered with imported figured velour plush; adjustable back. An exceedingly comfortable chair. Retailers charge $8.00 to $10.00. Order No. R72. Our Price **$4.50**

KITCHEN TABLE

A very handy time, space and labor saver; hardwood; top white and frame finished in the golden color. 2 drawers, 2 bins holding 50 lbs. of flour or sugar each, and 2 baking or meat boards. 26x46 in. Weight, 90 lbs. One of the greatest genuine bargains ever offered. Dealers ask $4.50 to $5.50. Order No. R491. Our Price **$2.95**

LACE CURTAINS

Made in imitation of and look like imported, and high-priced goods. Center has beautiful detached design, handsome ribbon and floral border, and edge woven to have the effect of the real ruffle. 48½ inches wide; 4 yards long. Exceptional value for the price. Order Number P122 ..... **$1.34**

SEWING Machine

Our very latest drop-head style. Strongly made, well finished in solid oak, does nice work, is guaranteed for 5 years and is a most wonderful machine for the price. This is positively the lowest price that any warranted machine is being sold for. Order No. L4350. Price, **$8.45**

We have everything in all grades, from the cheapest that's good to the best that's made. Write for catalogue at once, enclosing 15 cents to help pay the postage.

Our 2 Million Customers are the best endorsement of our goods, prices and methods.

Montgomery Ward & Co., *Michigan Ave. & Madison Street,* Chicago.[18]

first according to the quality, and second according to the amount of labor required. It is not an unusual thing for butter makers in Wisconsin to receive $75 a month, and frequently they have in addition to this, a house, and are furnished with fuel, butter and milk. On the other hand, there are a good many butter makers who are receiving $40 a month and less, without any perquisites. A creamery which is turning out from 200 to 1,000 pounds of butter per day, can afford to pay a competent butter maker large wages, whereas a creamery with a limited patronage must limit the wages paid to the butter maker.

Feeding Skim Milk to Pigs.

We have read with interest in your issue of January 16th, the article entitled "Skim Milk for Pigs" by Gordon H. True. We have to find use for large quantities of skim milk, and have been for the past year feeding it to pigs. We would be glad to have you tell us what should be fed with skim milk, and in what quantities at different ages, to bring forth the best results. W. T. W.
Maine.

It is hardly practicable to go over in detail such a subject as this in a single issue of HOARD'S DAIRYMAN. It is not only a very important subject but a very wide one, and one which enterprising farmers and feeders should study in all its aspects. To this end we would recommend this inquirer to provide himself with a copy of Prof. Henry's work on *Feeds and Feeding*. If it cannot be obtained elsewhere more conveniently, it will be sent from this office on the receipt of $2 00. Meantime we would say that experience seems to show very conclusively that mixing 1 lb. of corn meal or wheat middlings with from 3 to 5 lbs. of skim milk gives the most profitable returns. The amount to be fed cannot well be specified as this must be governed by so many local conditions and especially by the pigs themselves. The rule is to feed them all that they will eat without waste or leaving some of it in the trough. Repeated experiments have shown that when fed in this way 100 pounds of skim milk is easily equivalent to a half bushel of corn.

Cutting Corn Stover in Long or Short Lengths.

A New York subscriber asks whether it is better to cut dry corn stalks long or short for feeding purposes.

Like most other feeding problems this question does not admit of a direct answer. If the cut stover is to be fed dry we should prefer to have the cut long enough so that the cow could not turn the pieces on end in her mouth. On the contrary, if a considerable amount of the stover can be cut at one time, well dampened and allowed to lie in a pile and heat and soften it may with advantage be cut very short.

Distillers Dried Grains.

A Cincinnati reader asks us to give the analyses of distillers dried grains, remarking that our table specifies brewers dried grains but not the distillers dried grains, while the dealers in the latter claim they are much superior.

Distillers dried grains were not upon the market as such when our table was constructed and stereotyped, but we have frequently referred to them and prescribed them in formulas during recent months. They are substantially the same product as Atlas gluten meal which is mentioned in our table of analyses. Also there are several varieties and qualities upon the market known by the general name "distillers dried grains." Those made from corn are accounted much better than those made from rye.

Width of Feeding Alley.

A Missouri reades asks:

Can you give the exact width of feeding alley where stanchions are used on both sides, that is, what the width should be ?

This will depend very much upon circumstances. If it is desired to have the alley wide enough to take in a wagon for distributing soiling crops, 12 feet from stanchion to stanchion will be none too much. If it is only desired to have space enough for one to distribute hay with fork, or silage from a basket, this width may be reduced two or three feet. However, if one is building anew we unhesitatingly recommend the wider passage. A great trouble with our stables is that they are too small. The additional expense of adding two or four feet to the width of the building is very trifling, but the added advantage is very great.

hipping Milk Without Ice.

Can milk be successfully shipped 100 miles, to be out 12 to 15 hours without ice? If so, kindly advise as to a method. W. T. R.
Riceville, Tenn.

We do not think that the above could be successfully done unless the milk was produced under exceptionally cleanly conditions and even then we should expect a large loss from souring.

I don't make all the lamp chimneys; no trouble with mine.

MACBETH.

My name on every one.

If you'll send your address, I'll send you the Index to Lamps and their Chimneys, to tell you what number to get for your lamp.

MACBETH, Pittsburgh.

Buhl Factory Cans

represent the same maximum of superiority found in all cans bearing our famous Milk Can Trade Mark. They are made to be the **neatest, cleanest, strongest** and **most wear resisting** cans upon the market. It will pay you to know more about **Buhl Cans. Remember** the Buhl is the only can in the world that is made with the **Buhl "Victor" Can Breast** and the **Buhl "Victor" Round** handle that cannot cut the hands. We shall be pleased to mail you special circulars and other matter, which contain the helpful, money saving information you should have. When you read this you will know why there are more **Buhl Factory Cans** in use than of all other makes combined. Write us direct about cans and we will tell you where you can get them.

A Successful Convert to Dairying.

Some Silo Questions Answered.

ED. HOARD'S DAIRYMAN:—Mr. Alf. C. Watson, of Alamogovedo, New Mexico, wishes to learn more in relation to the door of the new model, round silo. He has never seen a silo, and has never talked with a man who has seen one. All he knows of them, he has learned from HOARD'S DAIRYMAN, and from Woll's book. He cannot realize how it can keep as it is claimed it does without salt, or anything of the kind to preserve it. Mr. Watson went to West Texas when eleven years of age, and lived there among the hostile Indians, till the Civil War broke out. He then enlisted and served till its close. He then returned to Texas and engaged in the stock business again till 1887, when he removed to New Mexico. He says he has always kept ahead of civilization. He has a wife and a small (?) family consisting of eight boys and seven girls. Two years ago, he and the boys who remain at home decided to go into the dairy business. Mr. Watson writes that he has no reason to complain of their success in dairying, considering that they had grown up among Indians and Mexicans, and had known nothing but Spanish ponies and long-horned, wild, Texas-raised cows.

A neat letter head shows that the boy is made more than a silent partner in the business, and that the milk is handled in bottles, and guaranteed strictly pure.

In answer to his questions, I will say that the hoops do not go across the door space; they are fastened to the posts, which are strong enough to hold them. The door is made of one inch boards, sawed just the right length to fit between the posts, and laid in one at a time, so as to break joints. These boards are not nailed together. The outer course is laid in a little more than the width of the building paper used; the paper is laid on and the cracks marked;then it is fastened, and the inner course of boards is laid; This is continued till the top is reached. As the silage is used out, the boards are taken off, and laid away for use the next season.

I will say to Mr. Watson that he sees nothing in HOARD'S DAIRYMAN commending silage, that is not strictly true. In fact, the more I use silage, the better I like it. The preservation comes, not by adding anything to the corn but by depriving it of the oxygen that the air contains. The principle is exactly the same as the canning of fruit or vegetables. The silage is always slightly acid, but when corn is allowed to glaze before putting it in the silo,is finely cut, and lightly tramped, it will be in practically the same condition it was in the field. The fundamental principle of ensiloing fodders, is the exclusion of the air. Silage once cured, in a good silo, will keep indefinitely, if left undisturbed.

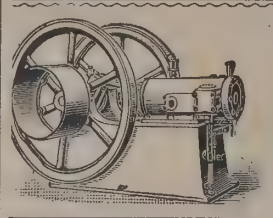
SILO QUESTIONS.

Mr. J. W. Howard, of Conetoe, North Carolina, writes that he wants to build a silo of one hundred ton capacity, and wishes to know whether he had better build of brick at $5.00 per thousand, or order one similar to the one described by me on page 953 of the DAIRYMAN.

I believe it is generally conceded that wood is by far a better material for use in building, than either brick or stone. It is usually the cheapest, too. If Mr. Howard can get Southern pine, hemlock, or spruce lumber, at fair prices, he can construct his own silo after the plans given in the DAIRYMAN, with ordinary farm labor and one day's work of a carpenter. This is a very cheap, servicable and durable silo.

For a silo of one hundred ton capacity, he will need one that will contain five thousand cubic feet of space, after allowing ten percent for settling. We will figure the size at five thousand, five hundred feet.

Of course the diameter and height may be made to conform to the space available for building, always aiming to secure height rather than breadth. If the silo is made fifteen feet in diameter, it will need to be thirty feet high, if eighteen feet in diameter, it would have to be twenty-two feet high. For the first form, three thousand feet of lumber would be required, for the second form, twenty-six hundred and fifty feet. The staves can be spliced by sawing into the ends and placing a strip of thin iron in each opening, like a dowel and these splices should be made to break joints.

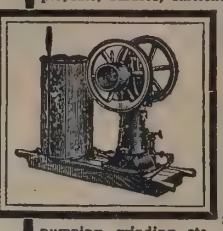


Maine. B. WALTER MCKEEN.

GASOLINE ENGINES

as power for the dairy have passed the experimental stage. Many dairymen now have them and all eventually must have them. The only questions to decide are the amount of power needed, and the most desirable make. With twenty-seven years of experience behind us, and a plant that has grown from 50 engines a year to 1500 a year capacity, we feel that we are equipped to build the best. There are other reasons why the "OTTO" is superior. We will tell them in this space from time to time. If in the meantime you need power, write us, mentioning this paper

THE OTTO GAS ENGINE WORKS, Philadelphia, Pa.



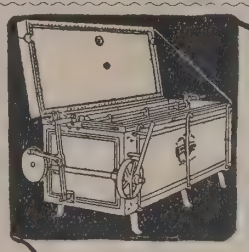
THOMPSON-LEWIS GASOLINE ENGINES

furnish the greatest possible power at the lowest possible cost in time, labor, fuel and money. They are so simple that anybody can run them without expert training or experience. Our **Volume Governor** gives uniform speed. Our **Acme Mixer** is the most positive and economical on the market. Our **Hand Starting Lever** starts engine with least effort. All bearings of **Phosphor Bronze.** Best material and workmanship throughout. Many sizes from 4 (actual) h. p. up. Best for all farm work—cutting and grinding feed, sawing wood, pumping water, separating cream, churning, etc. Send for our free catalog before you buy. It may save you time, money and annoyance.

J. THOMPSON & SONS MFG. CO., 113 BRIDGE ST., BELOIT, WIS

USE A POWER.

Here is one to fit your many needs to a nicety. Simple, safe, durable, efficient, fully guaranteed. The



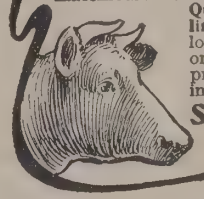
WEBSTER Vertical Gasoline Engine

develops **3 full horse power** on 2 to 3 cents an hour. Entirely self-contained, quickly carried from place to place to do farm drudgeries like sawing wood, churning, pumping, grinding, etc. We are headquarters for convenient all purpose engines, upright and horizontal. Write for free catalogue.

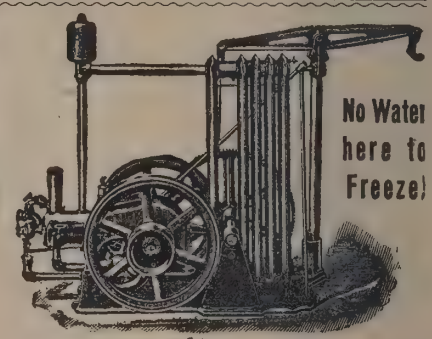
Webster M'f'g. Co., 1086 W. 15th St., Chicago, Ills.

DON'T BUY GASOLINE ENGINES UNTIL YOU HAVE INVESTIGATED "The Master Workman,"

a two-cylinder gasoline engine, superior to all one-cylinder engines. Costs less to buy and less to run. Quicker and easier started; has a wider sphere of usefulness. Has no vibration, can be mounted on any light wagon as a portable. Weighs less than one-half of one-cylinder engines. Give size of engine required. Please mention this paper. Send for catalogue. THE TEMPLE PUMP CO., ESTABLISHED 1853. Meagher and 15th St., CHICAGO.



The BOYD CREAM RIPENER



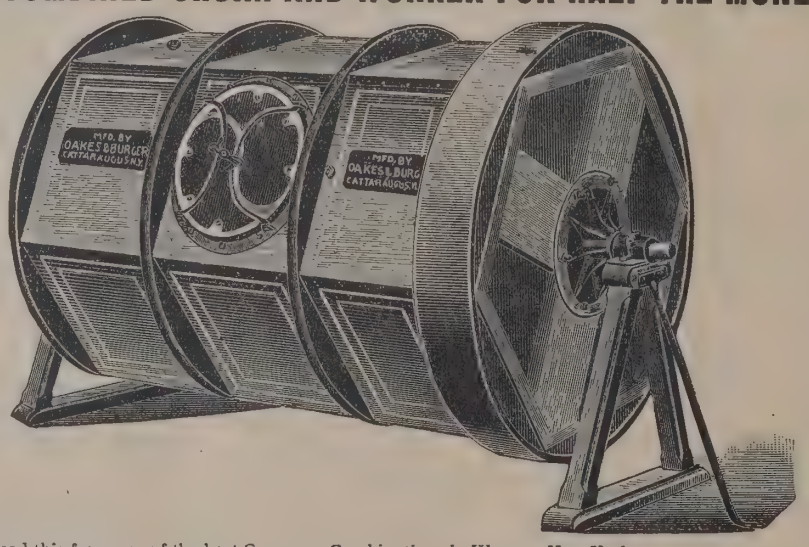
Wherever it has been introduced unqualified endorsements come, both from amateurs and experienced butter makers, upon "THE BOYD." It places cream ripening perfectly within the control of all, and reduces it to mathematical precision. Finer and more uniform flavors are the sure results. It possesses double the insulating properties and double the cooling surface of any other machine. Its cream distributor, affording rapid cooling and thorough aeration, all unite in making it the

Standard Cream Ripener of America.

We publish a special catalogue, our No. 12, devoted entirely to a description of this matchless machine. We mail it free upon request. We also manufacture the **Dairy Queen Churn, Standard Milk Cans, Cheese Apparatus and a general line of Creamery Machinery and Milk Dealers' Supplies.** Special catalogues for different lines. We are connected in no way with any trust or combination, and devote ourselves to supplying at reasonable prices, every article applicable to the creamery business. Write stating your needs, and we will mail free appropriate catalogue.

STURGES & BURN MFG. CO., Kansas City, Mo. Chicago, Ills. St. Paul, Minn.

No Water here to Freeze!



If you want a..... Gasoline Engine

that will be always ready to start, safe, reliable convenient, economical and durable, buy a **FULLER & JOHNSON Frost Proof.** No bother with water nor expense of broken cylinder, no waiting for wind or weather. All sizes, stationary and portable. Send for descriptive catalogue to the manufacturers.

BALTIMORE MARKET

BALTIMORE, Feb. 12—Butter—There is no change of moment to note in the situation during the past week. There appears to be a slight increase in the make at some of the creameries, but little if any improvement in the quality; the quality has in many instances been very unsatisfactory, and in order to prevent accumulations, concessions had to be made in order to induce purchasers to take hold, whereas the proportion of strictly fancy grades has been exceeding light, barely sufficient at times to satisfy the requirements of the local trade at full values. There is very little doing in held creamery. Imitation Creamery—Choice to fancy invoices meet ready sale. Ladles are in ample supply for present needs. Roll and packing stock are in more liberal supply; the demand is confined to sweet fresh stock; off grades are neglected. Blocks and prints, of choice to fancy quality, find ready sale. The market in general closes quiet, but firm on all desirable stock.

Creamery Separator, extras, 27c; firsts, 25@26c; seconds, 22@24c. June Creamery, extras, 25c; firsts, 23@24c; seconds, 20@22c; Imitation Creamery, extras, 20@21c; firsts, 18@19c; seconds, 15@17c, Iowa & N. W. Ladle, extras, — firsts, 19@20c; seconds, 15@16c. Prints, extras, 28c; firsts, 26@27c; seconds, 22@24c. Renovated butter, extras, 21c; firsts, 20c; seconds, 17@19c.

Eggs—The market, owing to the weather, has continued in a very tame and unsettled condition since our last issue. This week, so far with a decided increase in the receipts from all sections, there is no improvement to note in the situation; buyers will only take stock enough to last from day to day, fearing a still further decline. At the close to-day the market rules very quiet on hen eggs at 17 cents. Duck Eggs—All arrivals of large clean stock have met prompt sale; demand good; market steady.

Cheese—Offerings moderate; demand quite good; market firm on all choice to fancy stock.

N. Y. State—Cheddars, fine, 14¾@15c; choice, 14@14½c; fair, 13@13½c; Flats, fine, 14½@14¾c; choice, 13½@13¾c; fair, 12½@13c; Small, fine, 14¼@14½c; choice, 13½@14c: fair, 12½@13; Ohio Flats, fine, 13½@13¾c; choice, 12¾@13c; fair, 12¼@12½c; O. READING NOTICES.

All Reading Notices under this head are at the rate of 25 cents per line.

Butter Wanted—About 1,000 pounds of strictly fancy western creamery butter per month. Address SPRING LAKE FARM DAIRY, 815 George St., Baltimore, Md.

Wanted—Married man with small family for general farm and dairy work. To commence work immediately. J. S. HOPKINS, Dairyman, Roodhouse, Ill.

Position Wanted—By a cheese maker. Graduate of Wisconsin Dairy School Can furnish references. Address LESLIE HAZEN, Eastman, Wis.

Wanted—A capable and experienced man in dairy work, as assistant to foreman; also milkers wanted. For particulars as to wages and work, address KEYES FARM AND DAIRY CO., 3685 Olivet St., St Louis, Mo.

Wanted—To work on dairy farm, beginning April 1st, one married man to live on farm and board one or two men; also one single man. Must be strictly temperate and must furnish satisfactory references. Good wages and steady employment for the right parties. Farm one mile from P. O. Good church and school privileges. Address C. A. ROBSON. Red Wing, Minn.

For Sale—Milk route, retailing 160 qts. daily, 6 cents in winter. 5 cents in summer; complete bottling dairy outfit with modern wagon; farm of 90 acres next to city limits, 10 acres timber, young bearing apple orchard, also orchard of 75 peach trees 3 years old; 20 cows, thoroughbred Holstein bull, 4 horses, new power wind mill, ice up for summer use. Price $6,000. W. H. BOARDMAN, Vassar, Mich.

Wanted—An up to-date De Laval or U. S. separator in perfect order, capacity about 2,000 pounds. Belt machine preferred. Also a National butter worker, capacity 300 lbs. FINE VIEW CREAMERY, Fine View, N. Y.

Wanted—Guernsey heifer calves from registered sire and dam. WILL. W. FISHER, Watervliet, Mich. 2-2

For Sale—Cheese factory with dwelling rooms, also store or saloon. LOCK BOX 5, Shawano, Wis.

Wanted—An experienced cheese maker capable of running a factory on his own responsibility. Work the year round. Married man preferred. Address J. H. SMITH, Stork, Wis.

Wanted—A steady and industrious married man and wife to run small dairy farm. C. W. MOSHER, Elva Sta, Ill. 2-2

Wanted—Second-hand aerator, capacity about 2,000 lbs. milk per hour. J. W. GATES, Manlius, N. Y.

$50.00 will buy three-year-old Jersey bull, Duke Marigold 57029, St. Lambert, Stoke Pogis, Ida Marigold stock. J. A. WATERS, Copenhagen, N. Y.

Wanted—Single man to help milk and drive retail wagon. Must be sober and a hustler. Satisfactory wages to the right man. References given and required. Address THE ATTICA DAIRY, Attica, Indiana. 2-2

For Sale—Entire herds and flocks recently purchased from the Northern Wis. Live Stock Co. by the undersigned. Ten registered Guernseys—three bulls and seven cows and heifers. Twenty-two very highly graded Guernsey cows fresh and coming in. Eight two-year-old heifers in calf to registered Guernsey bull. Six one-year-old heifers. Six heifer calves. Seven high grade milking Shorthorn heifers fresh and carrying 2d calf. Fifty high grade Shropshire ewes and registered Shropshire rams. 46⅞ bred Angora Nannies in kid to pure bred Billys. Twenty registered Berkshire sows, bred, four boars and twelve November shoats. The cows are all under six years old and have been carefully tested and culled out for past few years and have not less than three crosses of Guernsey blood. Heifers have been selected only from best cows. Come and see, or write, as this is a good chance to secure a herd of high class dairy cows. J. E. STORY, successor to Northern Wisconsin Live Stock Co., Stanley, Wis. 2-2

Wanted—Position as second hand in large creamery. One year's experience. Best of references. Address BOX 98, Wilmot, Wis.

Wanted—A cheese maker to do secretary's work, make cheese and furnish his own helper in a cheese factory receiving 4,000 to 6,000 lbs. milk daily in summer and running the whole year round. Give references and wages wanted. Address IRON CREEK CHEESE CO., Menomonie, Wis.

For the land's sake—use Bowker's Fertilizers. They enrich the earth and the men who till it.

TWO FARM SEPARATOR FACTS

FOR BOTH

Creameryman and Patrons.

In every instance where experienced creamerymen, having a knowledge of separators and appreciating the necessity of a common interest between creamery and patrons, are putting in "Farm" separators on a considerable scale. - - - - - - - -

THOSE SEPARATORS ARE THE DE LAVAL.

In every instance where the sale of ANY OTHER MAKE OF "FARM" SEPARATORS is being attempted on a considerable scale, the parties are new beginners in creamery work or else mere promoters or what the conservative creamerymen term "pirates" in the business, in either case without knowledge of separators or the character of relationship between creamerymen and patron essential to the enduring prosperity of both.

The comparison speaks for itself—it is in keeping with the difference between the De Laval and inferior makes of separators.

Do You Want—A Hay Fork Returner? Every farmer having a barn should have one. A hummer for agents. Circulars free. ROONEY RETURNER CO., Box D., Independence, Iowa. 50-tf

For Rent—160-acre farm, large bank barn, 30 cows, large silo, wind pump, horses, hogs, implements. Give one-third. Milk one dollar and up. None but an intelligent cow man wanted. Farm adjoins corporation. Address D. E. CHILD, Findlay, Ohio. 52 3

Young Guernsey bull calf coming 1 year old for sale. MRS. A. W. LEHMAN, Neosha, Wis. 52-3

Wanted—A man with small family to work by year on 80-acre farm. Must be temperate and steady, with some experience in caring for and milking cows. Milk goes to creamery. Good position for right man. Address LOCK BOX 24, Litchfield, Mich. 1-2

Wanted—A first-class cheese maker to make American cheese. Must be sober, steady man. Single preferred. J. M. WILDHABER, Plymouth, Neb. 1-2

Wanted—A married man with small or no family to work on dairy farm. Must be a good farm hand and good milker. Give age, experience and wages wanted. For particulars, address BELLEVUE FARM, Negaunee, Mich. 1-tf

Wanted—To lease or rent cheese factories. State terms, amount of milk received and location. Will pay patrons of factory for milk basis highest market price of cheese. FOND DU LAC CHEESE AND BUTTER CO., Fond du Lac. Wis. 1-3

For Sale—Creamery, located 100 miles northwest of Chicago, with large local retail and wholesale trade. Has run ten years without a stop. Ill health cause for selling. Address "W", Hoard's Dairyman. 1-2

Wanted—100 choice high grade Jersey or Guernsey cows, fresh or soon to be. H. I. PIERCE, Columbus, Ohio. 1-2

Buff Jersey's Son, 23 years of age, will accept a position of trust on horse breeding, cattle feeding or dairy farm. Fully competent to manage up-to-date farm or ranch along any of the above lines. No bad habits whatever. Address BUFF JERSEY, Monmouth, Ill. 1-4

Later Departure from Chicago for Sault Ste. Marie, Mich.—Via the North-Western Line. The through sleeping cars for Manistique and Sault Ste. Marie, which have been leaving Chicago at 8 p. m. daily, except Sunday now leave at 10:30 p. m. daily, except Saturday, thus affording connection with trains arriving in Chicago at a late hour. The only through sleeping car line between Chicago and "The Soo." For tickets and full information apply to agents Chicago & North-Western R'y. 1-3

For Sale—Dairy business. Terms to suit. A good chance for one willing to work. J. P. SOUTHARD, Harbor Springs, Mich. 2-2

Wanted—A reliable man of good moral habits to run creamery. All necessary labor in creamery or first-class butter maker. Good helper furnished half of each day. Operated six days in the week. Age, wages wanted. Average milk supply per day for year 1902, 3,702 lbs. Give reliable references. Address J. R. WILSON, New Concord, Ohio. P. O. Box 334. 2-2

Guernseys For Sale—Pure bred bulls and grade heifers. A. H. HINMAN, Neenah, Wis. 2-4

Buff Jersey's latest book on Farm Stock and Dairy Work is full of practical things for practical people. The Silo, how to build and fill; ensilage, its value; soil, crops, variety and how to grow. Swine, poultry and many other subjects ably treated. Send 25c for copy. Monmouth, Ill. 47-tf

Wanted—Experienced farm hand, able to milk well. Give age and wages wanted. ST. IVES PARK FARM, Mont Clare Station, Chicago, Ill. 41-tf

For Sale—The Prairie Farm, 840 acres. May be divided into five farms with buildings. In high state of cultivation, 16 miles from Toledo. One hundred cows, selected for 40 years. Terms to suit. 5%. Address E. L. LOCKWOOD, Petersburg, Mich. 46-tf

Position Wanted—As butter maker or manager of creamery. Understand all details of creamery business and work. Fifteen years experience. Make cheese also. Best of references. Address B. care Hoard's Dairyman. 47-tf

Wanted to Purchase—Second-hand up-to-date creamery outfit for 500-cow creamery. Must be in first-class condition. W. C. CURRIE, Euclid, Minn.

Are You Looking for Land?—Come up to Crandon and see what we have to offer. Fine hardwood timber country, good soil and good water. The saw-logs have been cut, but there is lots of timber still left on the land; wood, ties, bolts, pulp wood, hub timber, etc., enough to pay for it. Land lies within less than a mile of the C. & N. W. Ry., and near county seat. Low prices and easy terms of payment. Write me for maps and circulars. L. T. CRABTREE, General Land Agent, Crandon, Forest Co., Wis. 51-4

For Sale—A milk route with 40 cows and equipment. Address Box 351. Grand Rapids, Wis. 52-4

Wanted to Buy—Old Stone and Pottery Indian Pipes. Address G. A. WEST, Herman Building, Milwaukee, Wis. 52-4

Half Rates to the Mardi Gras and Winter Resorts—Via the North-Western Line. On account of the Mardi Gras at New Orleans and Mobile, excursion tickets will be sold February 17 to 22, inclusive (and for trains arriving at Mobile or New Orleans by noon of February 24), at one fare for the round trip with favorable return limits. Excursion tickets are also on sale daily, at reduced rates, to the principal winter resorts in the United States and Mexico. For full information apply to ticket agents Chicago & North-Western R'y. 52-3

Guernsey Cattle—Clover Knoll herd. Send for circular. M. SAGER, Orangeville, Pa. 50 12

Guernsey Grade Heifer—For Sale 10 Guernsey grade young heifers. Seven of the lot 1 year old; 3 six months old, all in fine condition. Just right to serve as the foundation of a fine dairy. A finely bred young bull, 10 months old, registered Guernsey, to head the bunch. These heifers were bred from some of my finest grade Guernsey and Jersey cows. The lot will be sold at reasonable price. W. D. HOARD, Fort Atkinson, Wis. 52 tf

I want to develop the best and most modern sanitary milk producing plant to supply best city trade. A snappy young dairyman with good health and habits and some money and education is invited to co-operate. A gentleman of wealth who loves farm and dairy can also find pleasure and profit in assisting. Please investigate. BOX 1423, New York City. 52-4

Dairy Cleanliness.

ED. HOARD'S DAIRYMAN:—In a previous paper we briefly considered what pure milk is, and in doing so, showing the dire results of present methods as rendering milk impure, hinted at the radical changes necessary to produce pure milk. Barring adulteration and milk from infected animals, if you produce clean milk you will have pure milk. That is the sum of the whole matter, but it is very difficult to accomplish. First, cows are not built on sanitary lines, if I may so speak, to produce pure milk for man. Roaming the plains and producing milk only to raise her offspring she probably is giving it an aseptic or sterile food.

But as we stable them, her udder is too near the manure gutter, and if she don't get her udder directly in the excreta she switches the manure there and over her sides and her neighbor's with her tail. From a sanitary and health-view point the cow would be more of a success if her udder was placed similar to the elephant's.

Again our stables are anything but sanitary; the gutter is usually too shallow and narrow, the bedding is hay, straw, or chaff and full of dust, the lintel is most often under the hay mow, a place rich with bacterial dust, and in the large majority of cases the lintel is dark, and poorly ventilated especially in cold weather. This is all wrong from the milk supply view, and also from the cow's health view of the question, and actually resolves itself into a financial loss for the proprietor.

Dairy cleanliness, as interpreted by dairymen, is a very elastic term; it usually is only relative cleanliness.

A. says he has a clean dairy; but let a man go there who has made ever so slight a study of bacteriology in a laboratory, and he will undoubtedly find his cleanliness means he is cleaner than B. and C. I visited a dairy that has been described throughout the country. That day the whole stable had been washed throughout, the attendants were dressed in clean white suits, the cows and everything apparently was clean. I took samples directly from the milk pail and found about 1000 bacteria per c. c., not in one, but several samples.

I had an attendant get a clean towel wet in hot water, and had a few cow's udders and sides wiped just before being milked; in several samples there wasn't over 400 bacteria per c. c. As I was going back toward where the first samples were taken they were feeding grain to the cows that had been milked. I took more samples and found 3000 to 5000 bacteria per c. c., and those samples of milk soured standing in the room in 36 hours. The samples containing only 400 bacteria per c. c., kept sweet standing beside the latter 4 days. I followed this milk taking samples every time it went into a different vessel.

The combined aerator and cooler increased the bacterial content, the bottle filler still more, and the operator and bottles still more, so that in samples taken from filled jars there were millions. It was a revelation to me and also to the proprietor. This man was honest and said he would institute some changes and had me go out again. I went and he had reduced the bacteria to about 50,000 per c. c., and then said: "Well, I don't know what we will do without it, but that bottle filler has got to go, and we will have to sterilize the jars."

I said: "Yes and make the man who fills, stop catching up four jars at a time with each hand, by running his fingers into the neck of the jars."

In another dairy I found the stable, cows and attendants clean, but the cows were eating hay while being milked. As soon as they stopped that practice they had less than 600 bacteria per c. c. In another stable, equally clean to all appearances, as soon as they substituted planer shavings for hay and straw for bedding, they had less than 500 bacteria per c. c.

It seems to me these instances justify me in saying dairy cleanliness as practiced is a relative term rather than absolute cleanliness.

Then what would be dairy cleanliness? Clean cows, with udders and cows' sides dampened just prior to milking, this being done with clean water that has been boiled and clean towels A clean stable with the least possible dust in the air at milking time. Milkers with clean hands to begin with and washed between the milking of each cow if necessary, because of milk getting on them or handling anything dirty; and milkers wearing a clean suit of clothes at each milking; clean milk pails, cans, strainers and every utensil the milk comes in contact with, clean.

My notion of how these should be cleaned at the farm is this: each article first rinsed free from all appearance of milk in lukewarm water. (Please take notice here is a case where lukewarm water is good.) Second, wash thoroughly with water as hot as your hands will bear with a linen crash cloth, or good bristle brush, in which water you have first dissolved some good washing powder; never soap. Third, rinse thoroughly by pouring boiling water over them until the suds are all off. If possible put in the sunshine and just before using at next milking rinse with boiling water again. Dont use cold water to rinse with because the bacteria in the water will appear in the milk.

They may not be harmful, but several epidemics of typhoid have started from the practice. One such outbreak is enough to condemn the practice and stamp it as criminal, because of its fatal consequences on the unsuspecting and helpless victim, and also because it is absolutely unnecessary.

After milking, cool rapidly to a temperature of at least 50°F., 40°F. is better, and keep from contact with the air as much as possible.

From what we have thus far written it might seem that we would drive most milk producers out of business. Such is not the case, nor is it necessary to tear down all the barns and build anew, though if any have the money to invest, I don't know of anything that can be made to pay better interest.

The writer while learning these things could not afford a new barn so did the best possible with what we had. What we accomplished, and how, will perhaps be the best instruction possible for the general milk producer.

We had a herd of fifteen cows whose stable was a lintel under the hay mow and the barn was so arranged we could not get any sunshine in save for a few hours during the afternoon.

We first thoroughly cleaned all dried manure and cobwebs and dirt and dust out of that part of the barn and sprayed thoroughly with a five per cent solution of carbolic acid and the next day repeated the operation, spraying the cattle each time. After the second spraying we turned the cattle out and whitewashed everything but the windows, using the

"ADVERTISEMENT."

A CORKER

But Not Much of a Pastor.

There was an old clergyman in Central New York State some years ago who was a very powerful speaker but whose private life was by no means exemplary. Some of the more out-spoken of his parishioners were in the habit of remonstrating with him regularly about this and his reply invariably was "Don't do as I do, do as I tell you to do."

It is so with a great many physicians. There are hundreds of medical men who fully understand the folly of drinking coffee and tea, who tell their patients not to drink either, yet who use one or the other themselves. But sometimes it knocks even the doctor out and he has to quit Old King Coffee. A physician of Wasioja, Minn., says: "I was a liberal user of coffee from my youth and my health broke down while at college in 1880, at 25 years of age, but I continued to use coffee until 1898 although I was nervous and suffered constantly from a condition known as diabetes insipidus, a condition that is well known to be due to nervousness. My weight was below par and no diet or tonic medicines were sufficient to restore my vitality and strength.

"In 1898 I became suspicious of coffee and I broke off the habit by taking up Postum. Since that time my nerves have become strong and well and my weight has increased about 30 pounds. Well boiled, it is a delicious, healthful drink, heavy with strength and muscle making qualities." Name furnished by Postum Co., Battle Creek, Mich.

Even if your physician does drink coffee, you had better do as he tells you to do. Give Postum a trial. That's the easy way to shake off coffee and get well and keep well.

MILK BOTTLES

Don't have to be sterilized. Sterilizing won't make them hold any more or any less milk. It will, however, insure the perfect purification of your jars which are to be refilled. It is absolutely necessary that this should be done if jars are to be perfectly safe for constant use.

OUR IDEAL STERILIZING OVEN

Is conveniently and substantially made. It is constructed of heavy galvanized iron throughout, with either wooden or galvanized iron shelves. The doors are packed with cork and close with special compression levers that always produce a perfectly tight joint.

A Thousand Dollar Kansas Barn 36×60×20. Cement floors throughout. Frame of native timber; siding Norway pine box boards, and up to mow floor over half inch stuff and good building paper.

spray pump to put the whitewash on with.

Then this order was pursued twice each day, summer and winter.

About forty-five minutes before milking we carded and brushed the cows as clean as we could, and strung a rope across the stanchions so the cows could not lie down. Then cleaned the gutter and aired the barn. We then put on a clean canvass jacket.

Next scalded the pails, etc., and dampened one half a coarse Russian crash towel in boiling water and took our pails, keeping them top end down, and moistened the udder and sides and belly of each cow as we milked her, wiping our hands on the dry end of towel before milking. We then carried the milk directly to a small room shut off from the barn and run it over an aerator and put into the jars. All feeding was done directly after milking, and no more dust raised until next time. Taking samples every day for over a month, that milk when twelve hours old would show from 400 to 600 bacteria per c. c., and we did not reject the fore milk. When we did several times for experimental purposes, it would hardly show any bacterial life. In a room temperature of 70° F. it kept sweet two weeks.

Now, Mr. Editor and fellow milk producers, when by so simple methods as these so good results are achieved, we don't think there is any excuse for present conditions nor that our condemnation of present practices too severe.

Probably a large majority of the DAIRYMAN'S readers send their milk to the creamery or cheese factory and may think clean dairying will not benefit them. I would ask them why there is such a difference in the price of butter and cheese in the open market? I'm sure it is the difference in the degree of cleanliness. Again I know of dairies that are clean dairies that are selling butter for one dollar per pound, and cream for one dollar per quart. What does that mean? It means just this; that there are people who want clean butter and cream, that they will pay that price for it, and that it is so scarce an article that they cannot get it for less. It seems to us a statement of the case is sufficient argument for universal dairy cleanliness.

Mass. F. L. MARION.

Returning Butter Milk to Patrons.

ED. HOARD'S DAIRYMAN:—What do you consider the right and most satisfactory way of returning the buttermilk to patrons? If left to them to take their share, it generally turns out the first one that gets to the can is the "best feller," consequently the last man don't get any; then the buttermaker comes in for his share of cussing for not standing over the can with a club; have tried to solve this vexing problem many times. Some creameries charge so much per gallon to patrons, and that don't seem to give the best satisfaction; while others do not return any buttermilk at all,

While we believe the buttermilk should be returned to the patron, how can it be done in the most satisfactory manner, so each one gets what belongs to them? How would it do to keep enough hogs at the creamery to clean up the buttermilk every day, and when fitted for market, sell them taking out all expenses, turning in balance to patrons. E. S. P.

Coopersville, N. Y.

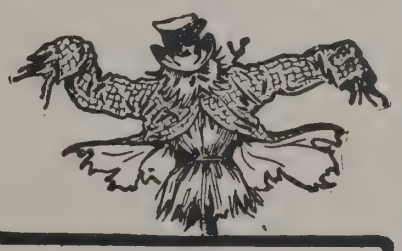
It is probable that some form of check pump would be the easiest solution of the question, dividing the buttermilk among the patrons according to the amount of butter fat each furnishes. Feeding hogs at the creamery does not seem to be a financial success, when tried on any large scale. This is probably due to the liability to disease and irregular feeding which usually occurs in such cases.

Indiana Butter Makers, Attention.

Purdue University Dairy School offers to butter makers a special course in starters and cream ripening, beginning Feb. 19th at 8 a. m. and closing Feb. 27th at noon.

Each member of the class will have daily practice in making and carrying along starters, ripening cream, scoring butter, testing milk and cream, and use of scales for cream testing.

Particular attention will be given to the practical work. This will be supplemented by lectures dealing with the principles involved.



Prof. H. E. VanNorman will have charge of the course and give the instruction in testing.

Instructor S. Burrage will lecture on bacteria in relation to cream ripening.

H. N. Slater, a graduate of the Minnesota Dairy School, and a butter maker of long experience, will give the work in starter and butter scoring.

Indiana butter makers should be prompt to take advantage of this opportunity to get some work that will be very helpful in their business. The Indiana Dairy School is well equipped with new apparatus, separators, testers, heaters, weighers, combined churns, etc.

Send application promptly to Prof. H. E. VanNorman, LaFayette, Ind.

It Doesn't Scare Folks
to be told the *truth* about
Lion Coffee
The scare-crow coffees are those that hide under a glazing of factory eggs, glue and such stuff.
Lion Coffee is pure, wholesome, unglazed, rich in flavor and uniform in strength. The air-tight, sealed package insures cleanliness, freshness and uniformity.

THE RICHEST CREAM
is not as rich and thick as the lather of Williams' Shaving Soap. The man who has once discovered the comfort and ease of shaving with
WILLIAMS' SHAVING SOAP
will never use any other. It is made just for shaving, by a firm whose business has been to make shaving soap for more than 50 years. **"The only Soap fit for the face."**

Sweet Taint in the Cream.

ED. HOARD'S DAIRYMAN—We have two patrons furnishing us cream, for retail trade, who are feeding ensilage.

Most of the time we notice rather a sweetish,objectionable odor in the cream.

It is the cause of some complaint from the trade.

Do you think it due to feeding the ensilage?

Is there any way to correct the trouble?

We have instructed them to feed it immediately after milking rather than before.

Don't think they practice after feeding regularly. D. H. E. SONS.

Louisville, Ky.

There is much uncertainly in attempting to state just where the trouble is in the above case, without further information regarding conditions. The silage may be the cause of the trouble either from feeding somewhat large amounts of a silage with a pronounced flavor or from allowing the milk to stand in the barn that is full of the odor of silage. As a possible remedy we would suggest feeding the silage after milking, removing the milk at once from the barn to a clean, cool room, and if possible aeration of the milk in a place free from all barn and silo odors.

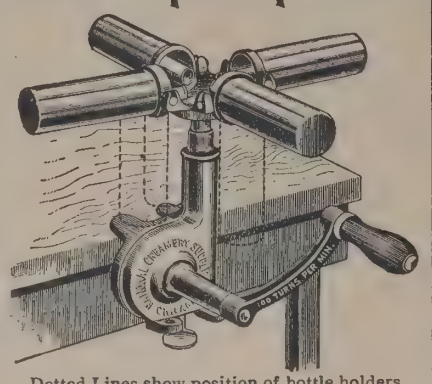
Our Jerseys.

ED. HOARD'S DAIRYMAN:—During 1902 our Jersey herd consisted of four two-year-old heifers, one three-year-old and twelve cows four years old and over. Calves were fed whole milk until two weeks old and a part ration of whole milk until six weeks old, when they were put on a ration of fresh separated milk.

We ran eighty-six thousand two hundred and sixty-two pounds of our milk through our separator, and from the cream made five thousand two hundred and eighty pounds of butter—an average of 310½ lbs. per cow. We sold four thousand eight hundred seventy-eight pounds for $1,163.43, an average of $68.44 per cow. A. L.

Pennsylvania.

A Question in Ventilation.



Mr. John Schmidt, Elk County, Pa., after giving HOARD'S DAIRYMAN a very handsome compliment, in stating that he can hardly wait until it reaches him every Friday, and that it has been worth at least $100 to him the past year, says that he has been remodeling his basement barn and made out of it an up-to-date cow stable, with cement floors, inlets for fresh air, ceiling of matched flooring overhead and twenty windows, mostly large ones, for admitting light. He has not yet provided the ventilating shafts for removing the foul air and as a consequence the walls on the sides of the stable are wet all around and half of the ceiling on the south side. Strangely enough the other half of the ceiling appears to be perfectly dry.

This difficulty will be overcome when he puts in the ventilating shafts, but his stable is so narrow and is so fully occupied for other purposes that, put these shafts where he will they will be more or less in the way, he thinks. This objection can be largely overcome by making the shafts not more than a foot deep and broad enough to give him the required amount of space, rather than to build them square. He can put in two or more and locate them at any convenient place in the stable, as it is immaterial where they are placed. The cold and foul air will find its way to these outlets in imperceptible currents.

In Olden Days men were broken on the wheel, now they buy **Electric Steel Wheels,** and save money. They fit any wagon. Made with either staggered or straight spokes. Let us tell you how to make a low down wagon with any size wheel, any width tire. Catalog tells. It's free. Electric Wheel Co., Box 130, Quincy, Ill.

ST. OMER HERD

Offers young bulls fit for service, out of tested dams with good yearly records. Strong in Exile of St. L., King of St. L. and Stoke Pogis of Prospect. Reasonabe prices. JOS. T. HOOPES, Bynum, Md

Exile of St. Lambert

—13657—

is the sire of more tested Jersey cows than any bull living or dead, and the number to his credit will probably never be equaled by any other bull. His dam was one of the largest milkers among Jerseys, and is the dam of the three year old cow with the highest year's milk record for that age. Exile's sire is the grand sire of the cow holding the highest milk record for a year.

The mid-winter sale lists include a few tested daughters of this great bull and several cows and heifers deep in the blood that produced this famous sire. If you wish to improve your herd, or to start one, you will probably never have a better opportunity than is here offered. If interested write for lists, and please specify whether bulls, cows in milk, or heifers, are wanted.

WINTERGREEN HILL FARM,
Scottsville, N. Y

Biltmore Jerseys.

The Evergreen Farm Herd has for sale three or four A. J. C. C. heifers bred. Also a few cows and some choice bull calves from two to six months old. Write for pedigrees and prices.

N. N. PALMER & SON, Brodhead, Wis.

FOR SALE. Clear View Stock Farm offers a few choice registered Jersey Bull Calves from 5 to 12 months old. Prices low if taken at once as must have the room.

J. S. CAMPBELL, Prop.,
Buttes, Pa

Composition of Vetch Seed.

ED. HOARD'S DAIRYMAN:—Will you please send me the analysis of sand or hairy vetch seed, also spring vetches or tares? I will have more than I can use for hay. There is no sale for hay, and the market is easily overstocked with seed.

The white or chickling vetch raised in Europe for bread and also for animals, has been found to contain a poisonous, alkaline, volatile liquid which, when taken too freely, causes lathyrismus. Horses, when fed on it a considerable length of time, drop while performing the lightest work, in consequence of paralysis of the hinder extremeties.

Have you found any of this liquid in the sand vetch or spring vetch? If so, would it be in sufficient quantities to prohibit its use in moderate quantities to the dairy cow. A. H. B.

Scio, Ore.

The above letter was sent to the Wisconsin Experiment Station and the following reply was received:

In regard to the composition of hairy vetch I would say that the seeds from this vetch contain the following amount of food materials: 16.2 per cent water, 24.0 per cent crude protein, 1.2 per cent fat, 7.5 per cent crude fibre, 3.1 per cent ash materials and 48.0 per cent nitrogen free extract.

According to Pott, the seed does not make a good food for milch cows and for horses only one-third of the ration should be made up of this seed as larger quantities have sometimes given trouble, he says. The seeds of this variety have not been examined as to alkaloids or other poisonous principles, but in the common vetch Ritthausen and Schulze have identified three different alkaloids. So it is very likely that hairy vetch also contains some alkaloids, hence care should be used in feeding the seed to farm animals. There is certainly not the danger in feeding this, however, as in feeding lupines, or there would be more known about the components of the seeds.

Madison, Wis. F. W. WOLL.

Washington State Dairymen's Association.

ED. HOARD'S DAIRYMAN:—The Washington State Dairy Association, which met this year at Kent on the 14, 15 and 16th of January, elected Mrs. E. Carmichael of Yakima City, Wash., secretary and treasurer of the Association for the ensuing year. This is the first time since the organization of the Association that this honor has gone to a lady, and in this case it is an honor well merited.

Mrs. Carmichael has an up-to-date creamery and a farm with nearly 100 head of cows and young stock on it, and is improving her herd so as to have the finest herd of milkers in this section, and in connection with the creamery and farm she also operates a general merchandise store. Truly, the new woman is coming to the front.

But this merely shows what a woman with energy and preservance may accomplish. Ten or twelve years ago this lady was left a widow with four small boys to raise and educate, and the results as above have been achieved with barely a little to start with, and the best of all, the boys have been well educated so that the two oldest occupy responsible positions in a bank. I write this short sketch solely to encourage the mothers who may be left upon their own resources. E. F. R.

Yakima City, Wash.

Butter Tests Accepted for Publication by the American Jersey Cattle Club.

Baronetti's Rose 132152—Sire, Fred Mayfield 44032; dam, Gilded Baronetti 31648; butter, 16 lbs., 4 oz.; milk, 283 lbs.; test made from Jan. 8 to 14, 1903; age, 6 years, 9 months; actual weight, 652 lbs.; fed 77 lbs. bran, 18 lbs. cotton seed meal, 8 lbs. corn meal, 175 lbs. ensilage and 49 lbs. hay. The right kind; bulls, cows, heifers. Write or come and see.
McKAY BROS., Buckingham, Iowa.

Note and Comment.

Up in Minnesota.—Dairying East and West.—Summer Silo.—Alfalfa and Bran.—Stable Ventilation.—Wooden Silo Hoops.

ED. HOARD'S DAIRYMAN:—It was quite a long step from Syracuse, N. Y. to Albert Lea, Minn., but Institute workers have often the faculty of taking long jumps and this is one of the many, but however long the step, this is the truth in reality, that there is no such great differences in the dairy gospel preached between east and west as once existed, and the universality of dairy thought, and the oneness of the desire, is striking.

The dairy student of the eastern states, and the very beginner on the prairies are both studying the same primer, and while the frontier dairyman's English is often apt to be a little mixed in construction and pronunciation, he is after the same truth and only the best seems to satisfy him. While he may, with the high prices of beef, be a little inclined to want a beefy cow, his heterodoxy is quite as pardonable as the "doxy" of the eastern dairyman, who is wedded to his calico cow of divers and complex breeding, that is as often a boarder as a profit maker.

Out west the dairyman is more restricted in his dairy operations. He does not have the great cities for a milk market like the Ohio and New York farmers. It is pretty near butter or nothing on the prairies, and some 1,100 creameries scattered over Minnesota are fast making her a "Bread and Butter state" for truth. The failure of some of the great syndicate dairy companies has made the idea that co-operation is best, pretty solid in western Minnesota, and the farmers seem to be more and more disposed to co-operate with each other than with a firm that the contract is about all that the farmers can see to judge by, as to responsibility.

What vast amounts of feed and roughage these farmers have, and in some sections seemingly very little of this roughage, is turned into feeding rations. "The roughage is too cheap to bother with, let the cattle help themselves," is still heard, but each year more attention is paid to its better saving and feeding. Silos are being built and liked. Dairymen are finding that with a silo and their cheap grains a warm barn, and the winter months are their best ones, and silage is far ahead of the summer pasture.

At Winnebago City, one farmer, Mr Bullis, "a 56'er," has built large silos and filled them with his best corn, and is feeding a big bunch of steers silage and oil meal, and says he has only by this method found out the possibilities of an acre of corn. It was a sort of a stand off between him and the dairyman who was the most benefitted by the silo, a cow or a steer feeder. Silo building and filling to my great surprise, is one of the very live subjects up here, and not the least interesting to the farmers is the possibilities of the summer silo, as in this almost semi-arid section the summer pasture and the soiling crop are two uncertainties; but the man who plants corn here, and cares for it with frequent and shallow cultivation, has yet to report anything like complete failure. It is asserted with confidence, that within the last 15 years, there has been a climatic or some other change in the eastern northwest, which has made corn growing a certainty, and wheat growing one of luck and chance. This is a fact. The winter so far in southern Minnesota would be recognized anywhere as the genuine New Jersey article, warm, pleasant days, with little snow, and south winds—ideal winter dairying weather.

It would seem that alfalfa was to have an inning this winter everywhere, and up here the Swedes and Norwegians recognize it as the old friend of theirs from across the sea, Lucerne, and here and there is a patch of it from seed sent from the old home. Those who have little lots of it tell of its wonderful feeding value, and some think a ton of it, as fine, cured hay, is quite as valuable as a ton of bran. From this I should not dissent, if the bran was like some western material shipped to the east, which was fully one-third cob dust. Mr. J. E. Wing, who is with our corps, has had great experience with it, both in Utah and Ohio, and he is sure the rich prairie lands of this section can be made to grow three and four crops of alfalfa per year. He does not disguise the fact that it is a difficult plant to get started, and that it wants a good deal of care in making a fine, nice, rich firm seed bed, and several clippings the first summer to keep back the weeds and foxtail, and give the clover strong root growth. From what I am hearing, there is only one serious objection that may come up in the growth of the alfalfa, and that is, that it may sometimes be difficult to rent land of neighbors on which to stack the surplus crop.

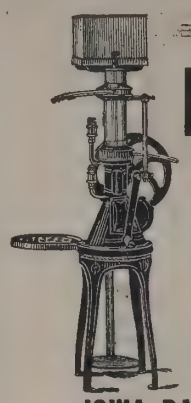
What you say about the ventilation of stables, Mr. Editor, on page 1074, is good dairy gospel. We had supposed we had good ventilation in our stable in past years, but it would gather moisture on walls and ceiling and a chill would be upon the air of the stable, and with sudden falls of the outside temperature there would be undesirable falls in the stable as well, with provoking falls in the milk, three falls in conjunction, which made bad footings in the monthly milk check. With the ventilators and the stable made closer than ever so that that the air must come in at the intakes, a great change was apparent. The condensation did not appear when the cold spells came. There was only a small drop in temperature in the stable, and the milk yield would change but a little.

I can only account for this on the supposition that the dry air of the stable with the change going on, prevents the fall in temperature which the more moist air would aid. In early January there was a fall in temperature outside of something over 58° in a day, but the mercury in the stable only went down from about 70° to 50°, which is the degree aimed to be maintained. The great thing is to keep the flues drawing all the time. We are convinced now that the small and very tall flue ventilator without bends and turns is the better and will pull, be it warm or cold.

This question of farm labor is the all important one of today. It is not merely a local one confined to one section, but extends to all parts of our country and Canada. The Dominion government is about to take action in regard to the matter, by giving inducements to emigrants from Europe, hoping thereby to relieve in a measure, the great scarcity of farm help. Here is an opportunity for the Grange and the various farm organizations to exert themselves upon. It seems as though inducements could be held out to farm laborers of the old world that might bring them by families to work on the farms.

I would like to see a few such families move into our section. They used to come here, and there are thonsands more there that would be glad to come here now if our immigration laws would allow them. If nothing changes the course of events and nothing occurs to relieve the scarcity of farm help, it will in a large measure curtail the amount of farm products, thereby increasing the demand and enhancing the price.

It will increase the sale of new and improved farm machinery, that kind that will make less hand labor possible. It will injure the consumers really more than the producers, but I can't shed any tears over them. I somehow can't show them any sympathy. Those who are willing to work on the farm rather than in the mills, can have the benefit of the good prices without condemnation from any sensible person.



I am of the opinion that the pails of beer and the saloons near by to the

BOTTLE BABIES

Bottle babies are so likely to get thin. What can be done? More milk, condensed milk, watered milk, household mixtures—try them all. Then try a little Scott's Emulsion in the bottle.

It does for babies what it does for old folks—gives new, firm flesh and strong life. You'll be pleased with the result. It takes only a little in milk to make baby fat.

We'll send you a little to try, if you like

Creasey Ice Breakers

Dairymen and shippers of milk and cream find them most efficient, economical machines, and the greatest savers of time and ice. Easy to operate. Rapid cutters. The design is right.
Made in sixteen sizes to suit every requirement. Send for catalogue "11-B" which gives full particulars.
J. S. L. WHARTON, Mfr.,
17th & Clearfield Sts. Philadelphia, Pa.

shops, mills; and factories are the determining factors in the choice between the city and the country life of the average laboring man. One thing I do know, the farmers who furnish hard cider or a jug to their hired help somehow never have a very hard time to secure it when they need it.

These things show the character and standing of the laboring classes of today. We stand in need of a class of such men who some day aspire to become farm owners themselves. It makes my hair red to be obliged to pay exhorbitant wages to a man and then have him take his weeks' earnings and drink them up every Saturday night at the saloon, having a good time with the "boys." There are one-half the laboring men that 3 dollars per week would be better to them than nine. Those same one-half spend their entire earnings for drink and their wives take in washing and scrub by the day to support the family.

I never begrudge a good wage to a man who will use it judiciously for the benefit of his family or lay it aside to buy himself a home. It's a pleasure to have such a man around, as he is a good, interested worker; faithful, sober, and industrious.

* * * * *

I notice that the manure question is being quite freely discussed through the columns of the DAIRYMAN and I would like to take a hand in the controversy. While there is probably no question but that where considerable help is constantly required about the farm that it is cheaper while one has the manure in the wagon or sled to draw it to the field where it is to be used, but there is considerable doubt in my mind but that such a method is attended with a very great loss in fertility, especially during a winter when the ground is frozen hard and there is a heavy snow fall. The plants are dormant, incapable of absorbing or taking up the fertility as the frost and and frequent thaws unlock it, and the soil certainly cannot receive it.

We have just been having a heavy thaw here and I had occasion to take a trip of a few miles and I saw two places where manure had been spread on level fields yet you could trace the discoloration of the ice on the roadside for ¼ of a mile to a culvert crossing the road, and how much further it went I do not know. Where there is so much color there must be some fertility.

H. E. Cook, our institute conductor, says "that the best farmers practice the daily hauling of manure to the field." He meant the men with the big painted barn and underground stables, not the best farmers. I believe that the old method of taking the manure from the shed or the pile to the land just previous to putting in the crop is far better as regards saving fertility than the every day grind in our snow and frost-locked latitudes. There will certainly be less leeching from one big pile than there would be from the same pile spread over a ten acre field.

I want the value of that manure pile myself, rather than give it to the adjoining farmers, or let it finally mingle with the blue waters of the old St. Lawrence. I will work my manure pile into the corn and potato fields and the plats we are going to seed down rather than put it on top of land already seeded and lose considerable of its value as humus. Humus on top of the ground isn't humus incorporated into the soil, because it will not remain humus so long, nor have the same loosening effect when the plow turns that field over again. No, readers, work your barn yard manure, straw, etc. into the soil, then you will get practically all the fertility and its value as humus also.

N. Y. JAS. M. PLATO.

Well Said.

A good old farmer who has lots of hard sense says:

"I have worked hard all my life to make mistakes that I never would have made if I could have had a chance to know some things when a young man, that every body can know now if they have any gumption at all."

We know lots of such men who are keeping cows. They are working hard day and night to make mistakes, yet no man can turn them. They learned but little when they were young and they have learned nothing since.

As the old Hoosier said about the sick horse, "Their eyes is sot." The Lord is good to such men. He gives them one cow in five that does all she can to make up for the other four mistakes. Let any man offer to show them a better way and they will turn away from him for fear he is a "book farmer."

An Oregon Feeding Inquiry.

W. W. S. Monmouth, Or., writes that he is milking ten cows, four of them Jerseys and six Shorthorns, varying in weight from 800 to 1,200 pounds. They began to freshen last June and at various times thereafter until November 25. He is feeding at present an average of 40 lbs. clover silage, 6 lbs. oats, 3 lbs. barley, 2 lbs. oil meal and all the clover hay they will eat up clean. He raises on the farm, the clover, oats and barley. Oil meal is worth $30 per ton; bran, $18; the market prices of oats and barley not given. His ten cows are giving 210 lbs. milk daily, and he is getting 27½ cents per pound for butter fat.

Notwithstanding, he is doing so exceptionally well, he asks if we would advise any change in his methods of feeding.

While our judgment is that he is feeding more grain than is really necessary, yet we hesitate to advise cutting it down very much; and yet it is our opinion that 4 lbs. of oats and 4 lbs. of barley, with clover silage and clover hay *ad libitum*, should enable his cows to do about their very best. At all events, we think he might try it with one or two cows and see what the effect would be. Do not make the change all at once, but gradually reduce the amount as above suggested; and if he tries the experiment, we trust he will report results.

"He Won't Die

Of consumption" is a remark often made of a fleshy man. The remark expresses the popular recognition of the fact that the sign of consumption is emaciation, loss of flesh. On the other hand, a gain in flesh is a sure sign that wasting diseases are being cured.

Emaciated people with obstinate coughs, bleeding lungs, night-sweats and weakness, have been perfectly cured by the use of Dr. Pierce's Golden Medical Discovery. The several steps of the cure were recorded in ounces and pounds of increasing weight. When there is gain in flesh the wasting disease is being surely cured.

Mr. Will H. Whitmire, of Arkton, Rockingham Co., Va., writes: "Our son contracted a deep cold about the first of July, 1899, and had a terribl cough. We called a doctor and he pronounced it irritation of the bronchial tubes, with asthmatic trouble, and he informed me that my son was liable to die at any time. He told me that if we could keep the bronchial tubes open, he *might* cure him; but after treating him several weeks and my son growing worse all the time, I concluded to try Dr. Pierce's Golden Medical Discovery and 'Pleasant Pellets.' I had seen several almost miraculous cures brought about by the use of these medicines, and of course I had wonderful faith in them. He used three bottles of 'Golden Medical Discovery' at home and one vial of the 'Pellets,' and was then well enough to go to West Virginia, taking a supply with him. I am just in receipt of a letter from him from which I quote: '*I am well and hardy and getting very fleshy.*'"

The Common Sense Medical Adviser, 1008 large pages is sent *free* on receipt of stamps to pay expense of mailing *only*. Send 31 one-cent stamps for the cloth-bound volume or only 21 stamps for the book in paper covers. Address Dr. R. V. Pierce, Buffalo, N. Y.

Salzer's Alfalfa or Lucerne.

Glory enough! Ring the bells! Shout for joy! The year of jubilee has come! How's that! Why, sir, it has been made possible to grow Salzer's Alfalfa Clover in every state in the Union, North, South, East or West—why, sir, cold Minnesota, and freezing Wisconsin, and treeless Nebraska, and the prairies of Illinois and Iowa, and the bottoms of Indiana, and the pineless soil of Michigan, and the rich farms of New York and Pennsylvania—yes, every state can grow from two to four crops of Alfalfa, if **Salzer's Northern Grown Alfalfa** seed is used! That's acclimated, that's hardy, that's tough, and we believe tougher and better than the Turkestan Alfalfa!

It's a Wonderful Clover.

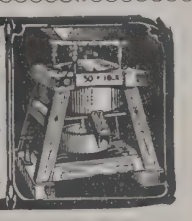
It's the greatest clover on earth, it's extremely early, the first crop cut in May, the second prodigal yield in July, the third in August, and lots and lots of pasture besides. It's great as a fertilizer, sending 10 to 25 feet after moisture and nourishment. It withstands drouth, wet, indeed, when once established it defies all elements, returning yields that will gladden the heart and fill the purse of every farmer growing same.

Look at This Testimonial.

Carl G. Kleinstueck, Saxonia Farm, Mich., has this to say: "I have a patch of Salzer's Alfalfa Clover that I seeded 13 years ago, which yielded four big crops last year, besides good fall pasture. It has been cut three times already this season, and the fourth crop is about six inches high today, and will be ready for mowing in about three weeks."

We have hundreds like it coming from all parts of the United States. It will pay you, Mr. Farmer, to give Salzer's Alfalfa a trial.

For 6 Cents.



☐ If you will mention HOARD'S DAIRYMAN when you write, enclosing 6 cents in stamps, we will mail you a sample package of **Salzer's Northern Grown Alfalfa Clover Seed**, as also our catalogue that contains the full description of how to grow with success this wonderously luxuriant hay and grass producing plant. Send today 6 cents in stamps for above and be sure to mention HOARD'S DAIRYMAN.

CONCERNING OUR ADVERTISERS.

A Pedro bull 4 years old, also some young cows of Signal and St. Lambert blood are offered for sale in advertisement among Jersey ads. by A. A. Eggleston, Painesville, Ohio. This is an offer of exceptional fine breeding and at extremely low prices. Don't fail to investigate.

The Wasson Stanchion Co., Cuba, N. Y., appreciating that the readers of HOARD'S DAIRYMAN are the most progressive dairymen in the country, have placed in our columns, this week, an advertisement of their Excelsior Revolving Stanchion. A great deal is claimed, and not without right, for this stanchion. It is comfortable for the cow and convenient for the owner. Full information regarding it the manufacturers will be glad to send. Drop a card to them referring to their ad. in HOARD'S DAIRYMAN, and request their circulars.

The pamphlet "Stassfurt Industry," just published, contains an interesting description of the famous potash mines in Germany, from which all the potash imported into this country and used for manuring is derived. The chapter about the use of potash in agriculture as one of the important ingredients of a complete fertilizer, adds largely to the value of the book, and among the many fine illustrations, those showing the experiments at Southern Pines, N. C., are of paticular interest to practical farmers. Copies of this pamphlet can be had free by writing to the German Kali Works, 93 Nassau St., New York, N. Y.

VETERINARY.

Queries in this department answered by DR. A. H. HARTWIG, Watertown, Wis.

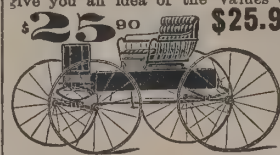
Atrophy of Muscles.

I have been trying to breed a fine colt 5 years old, and had her tied in the stall, and she pulled back till she hurt her neck badly and is so weak she can hadly stand up; she holds her head on one side, and her neck stretched, and the neck or flesh has shrunk away on one side. J. Q B.
Cayucos, California.

ANSWER.

The injuries to the neck have caused atrophy of the nerves and muscles of the neck. Apply a smart fly blister, once daily for three days, rubbing it in well each time, rest the third day and wash off the fourth; when dry apply clean lard to the surface.

Heart Trouble.



What would probably be the matter with a cow whose throat and cheeks become suddenly swollen, then her brisket, then her navel; lived 10 days after she was taken sick; ate quite a little, but with difficulty; kept her jaws going as if chewing; opened one of the bunches on brisket, after death and found it filled with bloody water, with something similar to beef suet floating in it.
SUBSCRIBER.

ANSWER.

The enlargements indicate heart trouble (pericarditis) which is a dropsical condition of the pericardium, and the blood water which you mention is common serum. There is no cure for this trouble, and it does not pay to apply medical treatment for it in the lower animals.

GREAT BUGGY BARGAINS

WE OPERATE ONE OF THE LARGEST VEHICLE FACTORIES IN THE COUNTRY, where we make a higher grade of vehicle work of all kinds than you can buy from your dealer at home, and our prices are about one-half the price charged by dealers. **OUR FREE VEHICLE CATALOGUE EXPLAINS OUR LIBERAL 10 DAYS' FREE TRIAL OFFER,** explains how we ship buggies subject to examination, payable after received, explains our binding guarantee, illustrates, describes and prices at incomparably low prices a big assortment of high grade Road Wagons, Runabouts, Open Buggies, Top Buggies, Surreys, Carriages, Phaetons, Stanhopes, Wagons, Carts, etc. **Our free Vehicle Catalogue explains how we make freight charges very low by shipping from Kentucky, Indiana, Minneapolis, Omaha, Kansas City or Des Moines, the point nearest you.** We illustrate below a few of our new 1903 rigs just to give you an idea of the values we are offering.

COMMON SENSE
Calf Feeder

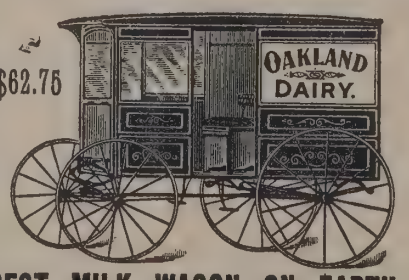
awarded **Gold Medal** at Pan-American Exposition. **The only Feeder** adopted by experiment stations. It is the kind others try to imitate. Easiest to operate and clean.

Most Durable, Simple, Economical, Scientific and Practical.

Do not be deceived by imitators. Shams are never imitated. **More Common Sense Feeders are in use than all others combined.** Over 50,000 in use. No valves to get clogged or foul. Nipples reinforced and cannot collapse. The calf feeder is a perfect weaner. A substitute for nature.

Extra gain on one calf pays for two feeders.

Best Feeder Made.
Michigan State Board of Health:—I tried every Calf Feeder I could find, but liked yours best.



Worth $10.00.
George S. Bement, Victor, N. Y.:—I am very much pleased with the Feeder and would not be without it for $10. No trouble, no damning, no milk on your clothes, no trouble to teach the calves to take hold of it, no sucking the cows, and the best of all is that when they get about eight weeks old they don't stop for the nipple but just drink out of the pail.

The Principle is Correct.
Purdue University Agricultural Experiment Station of Indiana, LaFayette, Ind.:—We have been using the Feeder to some extent and it is in constant use at this time and we believe it to be very satisfactory in its work. The principle of **Your Feeder,** I believe to be the correct one. C. PLUMB, Director.

Advise Stock Raisers to use it.
Maryland Veterinary Hospital:—I am very much pleased with the Feeder and would advise stock raisers not to be without one.

Price $1.50 including two nipples, sent postpaid for $1.75. We guarantee satisfaction, but if you are in doubt about its value we will send one on approval for 50c to cover postage, remainder to be paid if satisfactory. **Be Sure** and send for our twenty-two reasons why you should use a feeder. It's free. Sold by one dealer in a town.

JOHN WHITE & SON, Adamstown, Md.

Lice on Cattle.

Please give me a remedy for lice on cattle. In last week's paper, Vol. 33, there is an inquiry from F. D., Ardoch, N. D. The answer is "See lice this issue," and treat the same way. I have looked the paper through very carefully, but fail to find anything. L. D. C.
Marion, Wis.

ANSWER.

The answer will be found on page 1087.

Book on Diseases of Cattle.

Have you a book or could you recommend one that treats on the ailments of dairy cattle.
Frederick City, Md. E. H. Jr.

ANSWER.

Veterinary Elements by Hopkins, can be obtained from this office for $1.50 post paid.

Scabs on Calves.

I have 20 heifers that late in November I found some of them losing hair around their eyes. Later I found on their necks scabby sores, rough and scaley. When scab or scales are removed the surface is raw. I am using creolin with fifty parts water on them. Can you advise anything better? J. H. W.
Caskey, Ky.

ANSWER.

These scabs are produced by parasites which live under the outer layers of the skin. Your creolin preparation will destroy them, but you must not expect to accomplish this with one application. Apply it once every two or three days until relieved and take one quart of the creolin to five gallons of water and apply with a stiff brush.

Silage for Horses.

I have been feeding ensilage two years to cattle only. I have a friend here that began feeding it this winter to horses and cattle. His ensilage was well eared corn. His cattle are all right, but all of his horses, six in number, died within a week, after they had been fed on ensilage about one month. He does not know what caused their death unless it was the silage. I examined his silage and found it to be unsound in spots, lumps every few feet as large as a man's hat, badly decayed. Do you think the silage killed the horses? Is good sound silage used very extensively as a horse food and is it perfectly safe for same?
Greensboro, Ga. W. F. B.

ANSWER.

Experience teaches us that horses will not thrive on silage even if it is well preserved, and if it is partly mouldy it is dangerous to feed at all. We are inclined to believe that the silage may have killed the horses.

Hollow Tail.

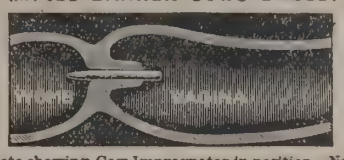
I send you a bit of cow tail which I saw cut off for hollow tail. What is the matter with a cow thus affected? SUBSCRIBER.
Corner, Ga.

ANSWER.

There is no such disease as hollow tail and the part you enclose is merely the most extreme portion of the tail, which comprises the skin and hair only, and none of the bone. This is a healthy tail, judging from its appearance, and should not have been cut off, as it is surely committing cruelty to the animal even if she be sick otherwise, as you are not bettering the case in the least.

Syringe for Abortion.

I am having trouble with my cows aborting. I am following the directions given in HOARD'S DAIRYMAN. Do you think a 16-ounce force syringe as good as a fountain syringe? R. J. B.
Elk Grove, Cal.



ANSWER.

You can make your own fountain syringe by taking a half-inch rubber hose about five or six feet long, then take hold of both ends, holding them up, and fill the entire hose full of the fluid. Then take your bucket full of the fluid and raise it two or three feet higher than the cow; place one end of the hose into the bottom of bucket and introduce the other into the vulva, but be sure that the suction has begun and the fluid is flowing freely. This will give a constant, steady flow and it is easier to apply. It is necessary to introduce your hand with the hose to make sure that you are gaining entrance to the uterus.

Gasoline Engines in Cold Weather.

How to Start Them.

ED. HOARD'S DAIRYMAN:—Some time ago I saw you said something about those having experience with gasoline engines, to give the same. I got one about a year ago, twelve horse power, portable; it might do to give the weight 4,910 pounds, and the better I get its tricks learned the better I like it. For filling silo I can do nearly a man's work at the cutter or in the silo. All the engine wants after it is started is to occasionally look after the oiling; in sawing wood, it is the same; grinding feed or any work it will do; and the starting, that is the rub till you get the hang of it, or you may feel as I did sometimes, nearly disgusted. You go in the testing room on the testing floor, and they will show you how easy it is to start the engine, and tell you that is all—all right for the indoor warm room, but just take it out and hitch onto the corn husker or shredder, with the thermometer at zero, or not more than 10° or 20°, perhaps, above, with a North-wester blowing through your bones; that is the time you may think ——.

Mine is an old-style igniter; they claim the later ones start easier, but I will tell how I started mine a few times, when I could not start it very easy any other way. Just set your torch going, get your tube hot, which will take 10 or 15 minutes, then take a rope, lay one end cross or nearly so, of face of band wheel, then roll band wheel, about six or seven times, having set your balance wheels right, all the rest also, then hitch a horse or team to the loose end and start them off at a smart walk or trot; of course you want to set on your clutch, and the thing is pretty sure to go.

Take a small engine that a man can turn the wheels by hand he is all right. One man said "heat your tube and heat the gasoline before putting in the hand pump, and you can start any time;" but the best success I have when I start by hand is to take a little cup I have to pour gasoline in the starter pump, and hold that to the hole when the match goes in, then take hold of a spoke of balance wheel and pull the piston back and suck in perhaps a teaspoonful or less of gasoline, then pour the rest or what it needs in the starter pump, then turn the wheel to position, put in match and pump as usual, and strike your match, that generally gets it off after two or three trials. This is for cold weather; it does not bother that way in warm weather.

Now I think if any one wants to run a separator pump, and do some other light work, a two to five horse-power would be about right, and I don't think he would want it larger, but for silo or shredding and that kind of jobs, not less than ten or twelve horse power. If he wants to run a threshing outfit he wants fifteen to twenty horse-power. V. W. K.

Rockton, Ill.

Lice on Cattle.

ED. HOARD'S DAIRYMAN:—Immersion for cows in winter time to remove lice seems to me to come under the head of cruelty to animals, and my sympathy for them brings me to the front again.

Soon after asking you for a remedy, a neighbor gave me an excellent one and it is this:

An insect powder—name unknown to me, but yellow in color—which costs from 40 to 60 cents per lb. (according to your dealer), thoroughly rubbed into the hair of the cattle and the surrounding folds of the udder, followed by a rubbing in of sulphur, will cause death to every insect it comes in contact with; repeat if necessary. I was advised not to apply it until the stock had been watered.

In connection with the above, the stable ought to be made as clean as a good broom can make it; whitewash as thick as it can be used, applied to the ceiling, sides, floor, stanchions and worked into the cracks and crevices; even with this treatment it sometimes takes three years to eradicate them. SUBSCRIBER.

New York.

FOR SALE. A Good Dairy and Stock Farm of 120 acres, well watered, spring at door, a running brook through premises, well fenced, good house and out buildings, a small grove, barn nicely fixed for 22 cows, separator room attached. Am in dairying and have a nice herd of grade Jersey cows, a registered bull 2 years old. all located within one mile of town of 2500 inhabitants. A good cream trade with principal restaurant. Creamery in town. Would like to sell farm, dairy stock and all. A Bargain to the right man. IRA D. FOTMAN
Lancaster, Wis.

"ADVERTISEMENT."

THE VALUE OF CHARCOAL.

Few People Know How Useful it is in Preserving Health and Beauty.

Nearly everybody knows that charcoal is the safest and most efficient disinfectant and purifier in nature, but few realize its value when taken into the human system for the same cleansing purpose.

Charcoal is a remedy that the more you take of it the better; it is not a drug at all, but simply absorbs the gases and impurities always present in the stomach and intestines and carries them out of the system.

Charcoal sweetens the breath after smoking, drinking or after eating onions and other odorous vegetables.

Charcoal effectually clears and improves the complexion, it whitens the teeth and further acts as a natural and eminently safe cathartic.

It absorbs the injurious gases which collect in the stomach and bowels; it disinfects the mouth and throat from the poison of catarrh.

All druggists sell charcoal in one form or another, but probably the best charcoal and the most for the money is in Stuart's Absorbent Lozenges; they are composed of the finest powdered willow charcoal, and other harmless antiseptics in tablet form, or rather in the form of large, pleasant tasting lozenges, the charcoal being mixed with honey.

The daily use of these lozenges will soon tell in a much improved condition of the general health, better complexion, sweeter breath and purer blood, and the beauty of it is, that no possible harm can result from their continued use, but on the contrary, great benefit.

A Buffalo physician in speaking of the benefits of charcoal, says: "I advise Stuart's Absorbent Lozenges to all patients suffering from gas in stomach and bowels, and to clear the complexion and purify the breath, mouth and throat; I also believe the liver is greatly benefitted by the daily use of them; they cost but twenty-five cents a box at drug stores, and although in some sense a patent preparation, yet I believe I get more and better charcoal in Stuart's Absorbent Lozenges than in any of the ordinary charcoal tablets."

A Handsome Book

About Mandolins, Banjos and Guitars, Free.

Any one interested in the subject of mandolins, banjos and guitars can obtain a beautiful book about them free by writing to Lyon & Healy, Chicago. It contains portraits of over 100 leading artists, together with frank expressions of their opinion of the new model Washburn Instruments. THE COMING DAIRY COUNTRY

Probably the richest farming country open for settlement to-day on the American continent, is the fine hardwood belt extending along the Minneapolis, St. Paul & Sault Ste. Marie Railway ("Soo" Line) in northern Wisconsin and Michigan. Acknowledged by good authorities on dairying to be the best dairy region in America. A land of Clover and Blue Grass well supplied with streams, lakes, and springs of pure water

W. D. HOARD, Editor of Hoard's Dairyman, says:

"I believe that northern Wisconsin is going to prove the most successful dairy region of the northwest, something like that of St. Lawrence and Lewis counties in New York.

"The peculiar salubrity of the air, the moderate heat of summer, the abundant and pure water, the good soil and luxuriant growth of grasses, all conspire to make it an ideal dairy region."

CHOICE LANDS AT LOW PRICES.

If you want a home in the "Great Clover Belt" write for free illustrated folder to D. W. CASSEDAY, Land Agent "Soo" Line, Minneapolis, Minn.

Irrigated Lands In Wyoming

The Big Horn Basin Country

Suppose you could get a farm of your own in a country where the soil is very rich and easy to work, where the climate is perfect and free from malaria, and where the biggest kind of crops can be raised year after year whether it rains or not, would you be interested? We have a folder about the Big Horn Basin of Wyoming, which tells all about that wonderful country and the great opportunities there for making money. Send for a copy. No charge.

670

FOR SALE. A fine farm in Sargent Co., North Dakota, consisting of seven quarter sections with lease continuing three years on two other quarters. **Three Hundred acres in cultivation, six hundred enclosed in four pastures, remainder outlying prairie.** Improvements consist of comfortable **two story house** with eight rooms, **a fine barn** 101x112 feet with capacity for stabling sixteen head of horses and eighty-four head of cattle in stanchions besides **calf stable** for twenty head and stable for young stock, besides box stalls for hospital purposes. **Two fine silos** inside with ninety ton capacity each, besides room for two hundred and fifty tons of coarse fodder, also **root cellar** 24x24 feet. **A creamery** 22x40 feet, two story with up to date machinery, a **feed mill and elevator** 18x32 feet with bins above to hold more than four thousand bushels of grain. Mill is equipped with a **three roller mill** besides corn sheller and grain cleaner and elevators and spouts and hopper, bottomed bins for the convenient handling of grain. Mill is connected to creamery by a building 20x28 wherein is a **water wheel which drives the mill and creamery,** also a **boiler for steam** heating and hot water for use in creamery. This room is also used for carpenter and blacksmith shop. Within this room is also located an **artesian well** yielding five hundred gallons of clear soft water per minute under a pressure sufficient to drive the mill and creamery. It also provides **water on tap in the house** and in **all parts of the barn** and flows off across the pastures making several small lakes and furnishes water on four quarter sections and finally flows off into a natural water way that leads to the Red River of the north. **A water wheel at the barn furnishes power for cutting ensilage** and other purposes. There is also a granary 18x32 with basement now used for **ice house.** The house is enclosed in a **beautiful lawn** of about **eight acres** wherein is the family garden. Several hundred fine forest trees have also been planted here besides some fruit trees all of which are doing finely. This is **one of the finest and most complete** plants for general farm purposes and for stock growing and dairying to be found in the northwest. Practical up to date farmers wanting a fine plant should investigate. For particulars address **BYRON PARSONS, Evansville, Ind.**

HARDWOOD TIMBER LANDS

from which the older trees have been cut but mostly covered with a fine growth of young timber, located in Marathon County, Centra' Wisconsin, are now offered for sale by us on most favorable terms to actual settlers.

This is some of the very best hardwood agricultural land in this state, with a deep, clay loam soil, gently rolling, with water easily obtainable at from 16 to 24 feet.

There is no better land for grain, grasses pastures, oats, peas, fruits or livestock, etc. Particulars will be furnished promptly on application.

RIETBROCK LAND AND LUMBER CO., Athens, Wis.

Dairy Business for Sale.

Operating on leased farm and distributing products direct to consumers at high prices. **Annual business over $25,000.00** and paying good profit. Stock, equipment, routes and good will offered at reasonable figure. **A Magnificent Opportunity** for individual of means and ability. Owner's attention demanded at other matters. Address "BUSINESS," care of Hoard's Dairyman, Ft. Atkinson, Wis.

Fine Dairy Farm for Sale.

Near St. Paul, Minn. 210 acres good land with ample buildings of all kinds. Page fence, cedar posts. Pure bred Holstein cattle and Yorkshire swine sell readily at good prices. Good markets for all dairy products. Will sell with or without stock and other personal property. Easy terms. Enforced removal to California only reason for selling. T. S. TOMPKINS,
Pasadena, Cal.

Dairy Ranche of 640 Acres

for sale, within one mile of the rising town of Macleod. This is a rare chance. For particulars apply **Box 34, Macleod, Alberta, Canada.**

STOCK FARM BARGAIN.

MARQUETTE CO. WIS.

240 acres, 100 acres in cultivation, 50 acres in timber, rich black loam, fine house, new barn, other buildings. A Bargain. Price, $7500. easy terms

For particulars address **J. H. MYERS,** C 100, Mack Block, Milwaukee, Wis.

450 Acre Farm

FOR SALE

Three-eights mile from electric car line. It has eight acres in asparagus, 4 acres in strawberries, and eight acres in orchard.

200 REGISTESED JERSEY COWS, CALVES AND GRADES.

Place has paid $4000.00 per year and a practical dairyman could make it $7000.00 per year. Will sell for about one-third cash down, balance on time. For full particulars address

E. P ODENEAL, Jackson, Miss.

Eagle Claw Hand Fodder Fork. Only tool invented that handles bound or loose fodder successfully. Write and secure exclusive agency. Randleman & Sons, Des Moines, Iowa.

FARM LANDS BURCHARD-HULBURT INVESTMENT CO. ST. PAUL MINN.

200,000 ACRES TO SELECT FROM

We own 40,000 acres in Red River Valley, in Marshall and Kittson Co's, Minn. and in Walsh and Grand Forks in N. D. 15,000 acres in LaMoure, N.D. Fine stock ranches in Logan and Mercer Co's, N.D. 50,000 acres of Timber land in Aitkin Co. Minn., and Washburn Co., Wis. Also 15,000 acres in Southern Minn. in Lyon and Redwood Co's, near Marshall.

The Advantage of Spaying Cull Cows and How To Do It.

ED. HOARD'S DAIRYMAN:—In traveling round our dairy farms it may be often noticed that a great many cows are kept, which not only prove a loss to the farmer themselves, but also eat up the profits which their mates give. What to do with these animals is a problem that is always troubling the dairymen. When a cow comes in with only three teats, and another turns out to be a very poor milker, or to have some other bad fault, his first thought should be to immediately dispose of these to the best advantage.

It is a very evident fact that if they are of no use to him for milking purposes, they are certainly of no use to any other person, and it would be impossible for him to dispose of them for anything like the amount he paid for them; his only means to take him out the difficulty is to fatten them. But then again, the bulls have been running with the herd, and even if they are not already in calf, they soon will be, as it is almost impossible on most farms to keep a few cows separate from all the others and the bulls. By the time they are fat the calf is pretty well matured, and they are of little use to the butcher. In a great many cases the dairyman decides to sell these faulty animals as springers, puts them into the public sale yards and says nothing whatever about their faults.

Occasionally, even the most careful buyers, are taken in with these cows, and when they again come into milk with their old faults the same process goes on the following season. The result is there are always a great many cows which are next to useless as far as dairying is concerned amongst our herds, to get clear of which there are only two methods open to the owner. He cannot milk them to advantage, nor when they are in calf, can he get rid of them to the butcher. So he must either accept a price for them far below what he originally paid, or else he must take in some other individual with them.

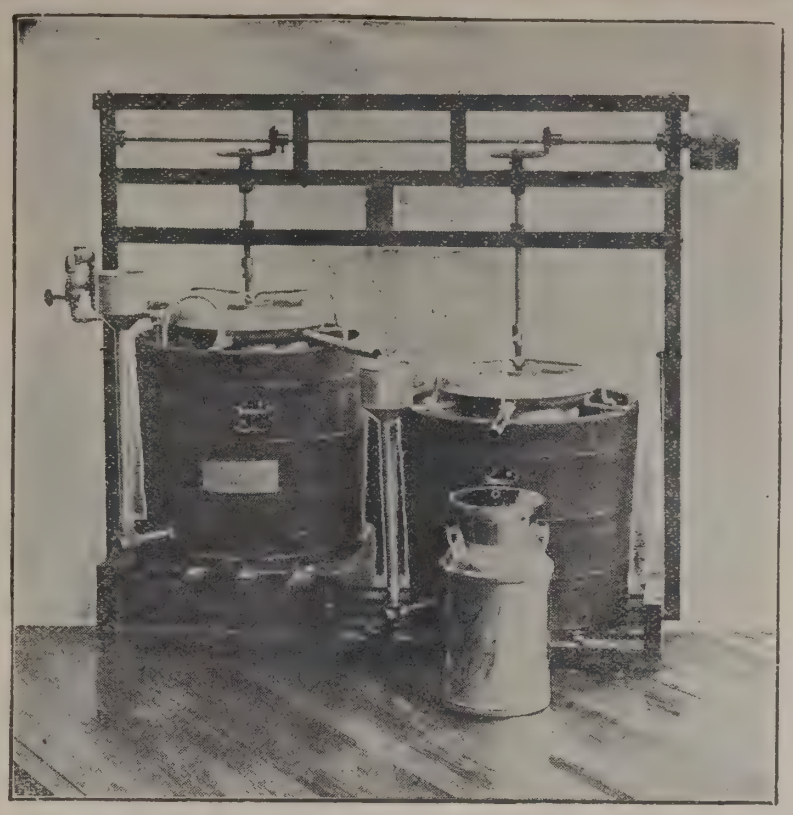
Apart from the fact that the latter alternative is un-British and an undesirable method, the dairying community as a whole, is in no better position. These faulty cows are still a drag on some one and there is every likelihood of their continuing so under that system. Now the natural and proper end for a cow which does not milk up to the standard which her owner considers payable is to be killed for beef, unless, of course, she has some especially good blood in her veins and her owner wishes to rear calves from her. It is quite impossible to prepare her for the butcher if she is permitted to get in calf; and as the way our dairy farms are worked it is not convenient to keep a few cows away from the bull, the only way to get rid of these poor animals is by spaying them.

The risk from spaying is considered by experts to be very slight, and has been proved by them to entail a loss of not more than 3 per cent. Spayed cows fatten readily, and their beef is equal, in quality to that of any steer. I think the best time to spay a cow is about six weeks after she has calved, and if she has managed to get in calf again before she is spayed, it is almost a certainty, though not absolutely so, that the operation of spaying will cause her, to slip her calf. She will have recovered again in the course of a week or ten days after the operation, and with good feed will commence to fatten right away. When she is spayed, there is no more trouble with her than there is with a steer; and if her owner wishes to hold her even though she may be fat, he can do so without the fear of her getting in calf again. The universal adoption by dairymen, of a system of spaying all cows which they consider are not worth milking, would prove a boon, not only to the individuals, by rendering their useless cows marketable, but also to the dairying community as a whole.

It the so-called dairy cows which are not really fit for the dairy, are prevented from breeding, it is evident that the only heifers reared would be those bred from the cows which are really profitable milkers, and it is much more reasonable to suppose that heifers bred from good milkers will turn out good milkers themselves than those bred from culls. So that any dairyman, who, when he finds out a cow is a cull spays her, gives himself a chance to dispose of her, and at the same time, confers a benefit on the community by preventing her from going on producing culls,

It is no more a necessity to obtain the services of a qualified veterinary surgeon to spay a cow, than it is to castrate a steer. In most dairying districts, men can be found who can perform the operation in an expert manner. The cows to be operated on should be kept ten or twelve hours without food before the time the operation is to be performed. An ordinary milking bail is quite sufficient to hold dairy cows. A sapling or piece of quartering tied to the bail and extending along the off side of the cow, can be held by a man standing some feet behind her, and will keep her quite secure.

It is a mistake to tie a cow up tight with ropes, as soon as she finds she is fast she will try to lie down; perfect cleanliness should be observed during the proceedings. A bucket of water with some disinfectant should always be handy to keep the hands and the wound thoroughly cleansed. The incision is made in the triangular hollow, between the last rib and the hip, and should be about 4 inches long, and about parallel with the last rib. When the hide is cut through the muscles are nicked until the transverse muscle, which may be known from its name and the transverse way in which it runs, can be observed. Then the hand is bored through the rest, care being taken with the inside lining, known as the peritoneum, which is elastic, and may recede from the hand. It will be known when this has been bored through from the fact that the air rushes in and causes an unmistakable sound. The next thing is to find the ovaries, which may be done by pushing the hand back, as if between the two hips and close to the backbone; the end intestine will be found pendent, just under the back bone.



This may be followed along backwards until the hand is in a sort of pouch, known as the Douglas pouch; then the womb will be immediately under the hand. By bringing the hand forward the womb will be found to divide into two spiral-like structures called horns. These are supported by a tough membrane called the broad ligament, just at the end of which, and at the end of each horn will be found the ovary, a small hard substance, varying in size from the size of a pea to that of a pigeon's egg. When ovary is found the spaying knife may be inserted with the other hand, and by holding it in one hand, and cutting with the other, the ovary is cut short off. The same is then done with the other. Care should be taken in sewing up the incision to only take the hide. Plenty of Stockholm tar mixed with grease to prevent it from blistering may be used, and the stitches will fall out in due course of themselves. A very good plan for any man intending to try spaying is to give himself a few lessons by carefully examining the anatomy of a cow which has died or been killed.

COMPETITION OF DAIRY BREEDS OF COWS.

Before dairying became the important industry it now is, farmers paid but little attention to the class or breed of cows they maintained for dairying purposes One cow was considered quite as good as another, except in a few districts, where dairying has been carried on for some considerable time. The extent of the business on the majority of farms consisted in keeping a few cows for home use chiefly, and selling any extra butter that might accumulate at certain seasons of the year. It mattered not then whether the animals were good or indifferent or what breed they were, and they consequently received the least amount of care possible.

But things are very much altered now, and those who hope to succeed in dairying, must strive to adapt themselves to the new conditions, giving greater attention to the improvement of the breed and management of the cows they milk. A question most frequently asked by farmers is, "What is the best breed of cows?" In that form, and without knowing anything about the circumstances of the farmer, or the nature of his land, the question is not susceptible of a definite answer.

Of distinct breeds there are many, and the lesson taught by local requirements is, that there is room for them all. In the multiplication of improved races of cattle there are some that claim a place in the competition for favorable notice; that is, a breed like the Ayrshires, for example, having adapted itself to the special conditions of a district, it may then be found suitable to those of other districts so that it spreads until we begin to think there are no limitations to its extension. But this is not the case usually, for if climatic conditions do not

A GREAT SUCCESS.

limit its usefulness, then the conditions under which its food is obtained, very often does.

The competition in breeds is, moreover, restricted by the use for which they are variously qualified, and while many compete in certain particulars, there are comparatively few that compete in every characteristic properly.

Some breeds of cattle are specially adapted for giving large quantities of milk of no very remarkable quality, in fact it is poor; others produce a smaller quantity of very rich milk, which makes them valuable to the butter maker, while yet others are best for cheese making, or are remarkable for their capacity for producing beef. The breed does not prove to be everything; for if the land and the climate are not suitable the keeping of a particular breed for the attainment of a special object is sure to end in disappointment, even though it has an excellent reputation over a very large area of the country. AUSTRALIAN.

The Manure Question Again.

ED. HOARD'S DAIRYMAN:—I would like to say one word about the manure question that I see discussed in your paper lately. I haul out about 200 loads manure every winter and generally haul it every day and spread it on the land and sometimes on a side hill. If it runs away, some say there is a waste and some say there is not any waste. What you see running away is simply what the scientific men call tannin.

I think they are right, for I have drawn 40 loads out on a side hill and put it all in one big heap. It was there until after haying, and then when I drew it away there were 32 loads, a loss of 8 loads. And below the heap for about one rod the grass was very large the next summer and for two or three summers after, but three rods below this heap the grass was not any larger than on the upper side of this heap.

Now, if the liquid from this manure loses its strength in three rods below the heap, then there cannot be much waste in spreading broadcast every day during the winter when we have plenty of time.

What do you say to this argument? Let me hear from some of the readers of your paper in regard to the matter.

New York. T. F. KELLEY.

Pit Silos—Sorghum Silage.

ED. HOARD'S DAIRYMAN:—I wish to erect a silo this spring and as there is none in this part of the country, I wish to inquire of you whether or not a silo could be built in the ground the same as a cistern and be a sucess? We can cement on dirt without walling. Will silage keep as well under ground as above ground. Does sorghum make good silage if properly cut. E. W. B.

Fort Scott, Kan.

In localities where the ground is a tough, hard clay pit silos have been tried with success, but the soil must be such that it will not crumble. In such cases the walls of the silo are cemented directly on the dirt in such a way as to make a smooth surface that will not prevent the silage from settling.

The only objections to such a silo is the extra labor of hoisting one or two hundred tons of silage out of the pit and the very decided danger in some cases of the formation of carbonic acid gas which is liable to form in such silo pits and which can only be removed by ventilation. Sorghum makes excellent silage, excepting a slight liability to acidity and this may be corrected by mixing corn with it. The mixture makes an excellent feed.

Can a Farm Separator be Afforded.

An Illinois reader says he has seven good Durham cows and asks whether it would pay to have a farm separator.

A few years ago, when farm separators were more expensive than they are at the present time, it was agreed that a farmer with ten cows could better afford to own a farm separator than attempt to raise cream with any of the gravity methods. We think the presumption is that our friend can now afford a farm separator with his seven cows, particularly as it is more than probable that he will soon increase the number of cows.

$100 CASH PRIZE FOR ANY STUDENT OF AN AGRICULTURAL COLLEGE OR FARMER

We hereby offer $100 in cash for the best article to be written on breeding and raising Hogs. Describe ten sows that you would select for breeding. Describe boar that you would select for a cross with these sows. Describe how and what kind of grain, grains or mill stuffs you would feed sows until pigs were farrowed. Tell how many pigs you would expect from the ten sows and describe how and what you would feed sows after pigs were farrowed. State when you would commence feeding pigs and what you would use. State when you would wean pigs and what kind of feed you would give them from that time until they were six months old and what you would expect to make them weigh at the expiration of six months. State why you would expect such results from your care and kind of feed used. Describe kind of pens and yards you would use for each condition. Our aim is to have you write an article describing in a practical way just how you would raise hogs to obtain the best results. **The breed of hogs selected will Not be considered in the decision. The use of "INTERNATIONAL STOCK FOOD" will Not be considered in the decision.** The decision will be published in every leading Farm Paper in the United States and Canada. Mail your article to The American Swineherd, Chicago, Ill., on or before May 10th, 1903. **The judges will be J. W. Baynes,** editor and proprietor of **American Swineherd, Prof. Thomas Shaw** of **The Farmer,** St. Paul, Minn., and **Henry Wallace,** editor of **Wallace's Farmer,** Des Moines, Iowa. These gentlemen are well known throughout the entire country and the decision will be rendered in May, 1903. The winning article is to be our property and will be circulated throughout the world and will attract universal attention of all swine raisers. **Who will win the $100 Cash and the Honor** and at the same time write an article that will be of great practical value to every stockman? ☞**Try for it.** ☜**You may be the winner.** All articles must be mailed to **The American Swineherd, Chicago, Ill.,** on or before **May 10th, 1903.** Mark your envelope ☞"International Stock Food" Offer.☜

"INTERNATIONAL STOCK FOOD" ☞3 FEEDS FOR ONE CENT☜ is Prepared from Roots, Herbs, Seeds and Barks and Won the Highest Medal at Paris Exposition in 1900 as a High-Class vegetable, medicinal preparation to be fed to stock in small amounts as an addition to the regular feed. It is a Great Aid in Growing or Fattening stock because it increases the appetite and Aids Digestion and Assimilation so that each animal obtains more nutrition from the grain eaten. We positively guarantee that its use will make you extra money over the usual Plan of Growing and Fattening stock. "International Stock Food" can be fed in safety to Horses, Cattle, Sheep, Goats, Hogs, Colts, Calves, Lambs or Pigs. It is Absolutely Harmless even if taken into the Human System. You insist on eating medicinal ingredients with your Own food at every meal. Salt is a stomach tonic and worm medicine, Pepper is a powerful stimulating tonic, Mustard is a remedy for dyspepsia, Vinegar is a diuretic. You eat these medicinal ingredients almost with every mouthful of your food, and it is proven that these condiments promote health and strength for people and improve their digestion. "International Stock Food" contains pure vegetable medicinal ingredients that are just as safe and as necessary an addition to the regular feed of your stock if you desire to keep them in the best possible condition. "International Stock Food" is endorsed by Every High Class Farm Paper. It purifies the blood, stimulates and permanently strengthens the entire system so that disease is prevented or cured. "International Stock Food" is sold on a "Spot Cash Guarantee" by Fifty Thousand Dealers throughout the World. ☞Your Money will be Promptly Refunded in Any case of failure. It will make your Pigs or Hogs grow Amazingly and has the largest sale in the World for curing or preventing Hog Disease. ☞Beware of the many Cheap and Inferior Imitations! No Chemist can separate all the Different powdered Roots, Herbs, Barks and Seeds that we use. Any One claiming to do so Must be an Ignoramus or Falsifier.

GIVEN AWAY FREE

The great blood purifier, Zaegel's Swedish Essence of Life, is to be given away free to readers of this paper. This famous remedy comes as near being a bodily restorer as we are ever likely to find. When taken into the stomach it acts so pleasantly upon the digestion that a good healthy appetite results; and the liver, bowels, kidneys and bladder all come in for a share of the new strength and vigor. Rheumatism, backache and headache, biliousness and all nervous diseases are rapidly cured as well as diseases peculiar to women. There are times when a person would give almost anything to be rid of a frightful headache. Zaegel's Swedish Essence will relieve it right away. And the sour stomach, constipation, lack of energy, backache and the hundred or more little ills with which we are attacked so frequently will be quickly cured by this famous remedy. No one need trouble themselves to doubt whether this remedy will do all these things as you can have a free trial package first and see what it does for you.

Zaegel's Swedish Essence is so well known that probably quite a number of our readers are already using it but this makes no difference as a free trial package will be sent to everyone who writes. Do not neglect to get in your application at once. The best way is to sit down this minute, write a letter to M. R. Zaegel & Co., P. O. Box 989 Sheboygan, Wis., and say that you want a trial package of Swedish Essence of Life. This will be sent you by mail and is large enough to convince you of the merit of this celebrated household remedy. A 2-cent stamp should be enclosed in your letter to pay the postage on this free sample. Write for it to-day.

What Does Clarifying Remove From the Milk?

An Inquiry for Mr. Marion.

ED. HOARD'S DAIRYMAN:—It gives me very great pleasure indeed to read your paper as it arrives each week, but your correspondents occasionally make statements which are apt to be misleading. On page 1048, I notice a letter from Mr. F. L. Marion in which he says that "Clarifying not only changes the physical condition of milk, but removes a large part of one very valuable constituent, which is a sad loss in the sick room and in infant feeding."

Will Mr. Marion kindly inform me, first, as to his proofs that the physical condition of the milk undergoes a change, and second, as to the valuable constituent that is removed. If he will clear these two points I shall be glad to give the results of our work in clarifying and distributing to our city customers some 26,000 pounds of milk, daily, and this without any change in the milk, or the removal of any valuable constituent that we know of.

On page 1050 of the same issue, Prof. Dean is credited with the statement that, "Aerating of milk in Canada does more harm than good. The milk should be cooled as soon as possible, but not by that process." This may be true for cheese making, but all our experience in the city milk business goes to show that milk for city distribution should be aerated first and cooled afterwards. If this aerating is not given careful attention "smothered" milk will be the result. While I can quite understand that aeration among filthy surroundings is objectionable, yet, if the farmer is a capable milk producer the surroundings will be such that aeration should be beneficial rather than injurious.

I should like to hear the opinion of others on this latter subject, also to have Mr. Marion's experience in clarifying milk.

W. J. PALMER,
General Manager, City Dairy Co., Limited.

Heavy or Light Cream.

A Buttermaker's Reasons for Preferring The One to the Other.

In his address on "Heavy or Light Cream" before the Michigan Buttermakers' Convention, Jay Pullen of Parma, gave these observations:

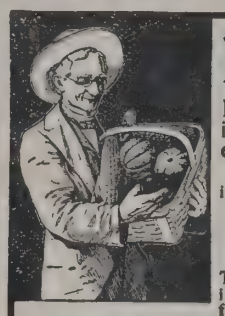
I find that there is quite a difference of opinion in regard to what per cent of cream gives the best results in making butter.

By visiting other creameries I find the boys are running a cream anywhere from 25 to 50 per cent and are all claiming to be getting good results.

I think from this, it would be hard to draw the line as to what per cent would give best results. From my experience I would recommend 35 to 40 per cent in winter, as at that time we are using a starter which will bring our per cent to about 30 or 32, which is about an ideal cream at this season of the year. If we try to churn a much heavier cream at this season we will have trouble by its sticking to the sides of the churn and not falling enough to come: while a very light cream would be a long time churning and we would find it would be hard work to get it together in large enough granules so as not to bother by running out with the buttermilk.

In summer I think about 40 to 45 per cent is about right as we are liable to get milk that is a little changed and by running a heavy cream we have less cream to cool, making onr ripening easier to control, and by churning a heavy cream it will churn quicker and you can churn at a much lower temperature, making your butter come in fine granules which will secure you good texture and body; while by running thin cream we will have more to handle, making cooling slower and if we are not very careful in handling a light cream in summer, the ripening process will get the start of us and the results are we will have overripened cream and a cream that will be full of curd, making it impossible to strain, and unless churned at a low temperature and washed three or four times our butter will be full of white caps, or more commonly called mottles.

A very large amount of the trouble from poor churning in private dairies comes from attempting to churn a thin cream. The same reasons which make it advisable to churn a heavy cream in a creamery, will apply to the private dairy, and the same favorable results will be obtained.



The Maule Seed Book

for 1903 is free to all interested in gardening who mention this paper. If you want an up-to-date garden you ought to have it, the best seed catalogue I have ever published. The first edition alone costs over $37,000. Address

WM. HENRY MAULE,
1711 Filbert Street,
PHILADELPHIA, PA.

SEED CORN

All the leading and best varieties of choice selected, thoroughly tested seed corn, which have yielded 75 to **215 bushels per acre. Costs Only 25c Per Acre for Seed.** Large descriptive catalogue of Corn and all kinds of Farm and Garden Seed mailed free if you mention this paper. IOWA SEED CO., DES MOINES, IOWA.

Everything for the Garden

Is the title of **Our New Catalogue for 1903**—the most superb and instructive horticultural publication of the day—**190 pages—700 engravings—8 superb colored plates of vegetables and flowers.**

This Is to Tell Those Who Read It Why

Windmill Prices Must Go Up

Twenty years ago a 12-ft. wheel cost $160.00, and but few bought them. It was a prohibitive price which the invention of the steel wheel has made forever impossible.

When the Aermotor Company came into the field with the first 8-ft. steel wheel, which did the same work for $40.00, it "took the country." Later the price was reduced (without competition) to $25.00 and the downfall of the Aermotor Company and the ruin of the windmill business was freely predicted. But the result proved otherwise. The price at that time was enough. Iron and steel were low, labor was plentiful and cheap, and the man at the helm of the company foresaw that, for a few years at least, the cost of production would be less than it ever had been or would probably ever be again. It was his opportunity and he grasped it.

The Aermotor went everywhere. Where one went others followed rapidly, and the business soon reached immense proportions. By foreseeing the advance that came with prosperous times, and purchasing large quantities of material before prices advanced, the company has been able to continue the same abnormally low prices for three years in the face of a market that has doubled the cost of material and added a large percentage to the cost of labor. It did this in the hope that iron and steel would come down, but they have not and there is no prospect that they will. On the other hand, the cost of material and labor is constantly increasing. How far this may go no one can predict. To meet present conditions, a small advance in prices has become necessary. This advance does not nearly represent the increased cost of production, and it is quite probable that increasing cost of material may make further advances necessary.

THIS IS THE TIME TO BUY

If you expect to need a windmill this year, now is the time to buy. Prices may soon go higher. They certainly will not be lower. Money put into a windmill now will be well invested. Many dealers bought a stock of Aermotors before the recent small advance and will be able to sell now for lower prices than later. If you buy now you will be sure to have your windmill up and ready when you need it. Windmill men are not so busy now as they will be later. You may be disappointed if you put the matter off. You will not miss it if you buy now.

IT IS IMPORTANT THAT YOU BUY RIGHT

Buying a windmill is an important matter. You will have to live with it a good many years. It will either lessen your burdens or add to them. Water is needed every day of the year. The Aermotor was made to pump it for you. It has never failed to carry out the purpose of its creator. The first Aermotor distinguished itself by running when all other mills stood still. Each one of the succeeding hundreds of thousands of Aermotors has done the same. The reason for this is simple enough. The Aermotor was the result of design, not accident. It was made for a purpose, and that purpose was well understood in the beginning. Every requirement was carefully determined in advance. Every strain was accurately estimated. Every pound of material was arranged to the best advantage. Simplicity was added to strength. Each object to be accomplished was aimed at directly. There were no unnecessary parts, no wasted material, no stupid devices.

An Aermotor once properly erected, requires no adjusting or tinkering. This is the result, not only of perfect design, but of proper construction. The best material for each part has been carefully determined, and only the best is used. Much of the material in the Aermotors is specially made for that particular purpose. The very stiff sheet steel used in the sails is made only for the Aermotor Company. Even the Babbitt metal used in the bearings is specially made to meet the peculiar requirements for a windmill.

THE AERMOTOR COMPANY KNOWS WHAT IS BEST IN A WINDMILL

It is not a difficult matter to make a windmill. They have been made for centuries. It is, however, a difficult matter to make the best that can be made. To do that requires peculiar skill and ingenuity. The Aermotor Company, alone, has shown remarkable originality or genius in the business, It has had more experience than all others combined in making steel windmills. Isn't it fair to conclude that it knows what is best in a windmill? The best costs no more than an inferior imitation. If you buy anything less than the best you do not get the most for your money.

But the best may be a dismal failure if poorly erected. The erector must know how to plan the job, get the parts together properly, and detect the least thing wrong with its working. Aermotor dealers know how. They are selected for that reason. Most of them have been handling the Aermotor from the beginning. They are men of trained judgment and mechanical ability. To get the best out of the best mill, one of them should erect it for you.

WRITE FOR OUR WINDMILL BOOK

We have a book that tells all about windmills. It begins with the Dutch wind mills of 1400 and ends with the Aermotor of 1903. It contains 125 pictures to show you what windmills should do and what they should be. It tells all that invention has done for them. When you read this book you will know all that anyone knows about windmills. You will know the right kind from the wrong kind and know all the differences. To avoid a mistake don't buy without reading it. The book is free. Simply write for it.

RUPTURE CURED while you work. You pay $4 when cured. No cure, no pay. ALEX. SPEIRS, Box 846, Westbrook, Me.

Don't Cross the Breeds.

ED. HOARD'S DAIRYMAN:—Many times I have wished I had some of those Jersey herds of cows that are heavy milkers and good testers that so many talk about crossing with this Red-Poll dual-purpose or Holstein bull, as I am not able to buy thorough-breds at high prices.

I fed three full blood Jersey calves all last summer and took two back in the fall to the owner, and kept one bull which will start my herd in the right direction to suit me. I have nine cows, six being grade Jerseys. It will take years to get them this way, and seems to me men are foolish to cross these so-called dual-purpose sires on dairy-purpose cows, and spoil years of careful breeding.

From eight cows the past season I got $420; I fed to same $60 worth of grain. We have a DeLaval separator and make our butter at home.

I am another of those 5-months subscribers, and think your paper very helpful. JERSEY.

THE CELEBRATED

HAPGOOD-HANCOCK Disc Sulky & Gang Plows

Changes the old method of plowing as the twine binder did the old method of harvesting. We guarantee to do more and better work with two horses on sulky, or three horses on 24-in. Gang, than any other Mould-Board or Disc Sulky with three horses, or Gang with four horses. No Mould-Boards, Shares, Landsides or Rolling Coulters to wear out or keep in repair. Will plow hard dry ground where no other plow will work. We want you to see it in the field and will give **liberal discounts on the first plow** and special inducements to help us introduce it in your neighborhood. We are exclusive mfrs. for two-thirds of the U. S. of the genuine **Hancock Plow**, the only plow branded or advertised as **Hancock**. Beware of cheap imitations that look like our plow, but which lack the essential elements (covered by our patents) that make the Hancock Plow a wonder and the only successful Disc Plow on earth. Write us now. Address

The Alfalfa Plant.

Twenty-five years ago, the millers of Minnesota and other states as well, threw their wheat bran into the nearest river to get rid of it and many thousand dollars worth of feed and fertility was wasted because no one considered it worth saving or feeding. We are now at the other extreme and every dairyman is hunting for protein feeds and paying high prices for bran and various waste products of the food factories. There are fashions in feeds as well as clothing, and for years bran has been exploited as a most necessary dairy food, a kind of staff of life for the dairy cow, and the result has been a demand that, as is usual in such cases, forced the price beyond its actual feeding value and with an accompaning lowering of its value by adulteration with various weed seeds, ground corn cobs and other things that are of little or no feeding value.

It is evident that the time has come to substitute something else for bran, for there is no indication of either lower prices or a falling off in the demand, and the farmer must turn to some other source for his protein. Among the many substitutes, there is one plant that seems to stand pre-eminent among its fellows, and that is alfalfa. It is one of the few plants that by history, tradition and practical results deserve to be classed with corn, wheat and cotton as being of great value to man, and yet its good qualities have been slow in being recognized.

For years the eastern farmer has known, in a general way, that on the Pacific coast states alfalfa has been recognized as a most valuable crop, but it has been considered that the western climate was necessary to the proper growth of the plant, and the attempts made to grow it in the Mississippi valley have been of a very half-hearted nature, and as is usual in such cases failure followed; but the time seems to have come when alfalfa will take a prominent place in the agriculture of the country, but before this can be done there must be a full understanding of the methods to be used in raising it, and the possibilities and probabilities of the plant.

HISTORY.

The alfalfa which is grown in this country is the *Medicago Sativa*, Lucerne, Purple Medeck, or more commonly, alfalfa. This last name is probably of Arabic origin and was brought to Mexico with the plant by the Spaniards and has followed the plant in all its migrations on this continent.

The name Lucerne is probably of French derivation and was the name given to it by those who brought it to the eastern coast of America some 150 years ago. Like many other cultivated plants, its native home is unknown. It is found growing in Persia and, in fact, in all parts of Western Asia it is found growing wild in much the same manner as sweet clover is found in this country. It is said to have been introduced into Greece as early as 500—450 B. C., during some of the early Persian wars.

The old Romans, among the other treasures that they gathered from all parts of the world, obtained alfalfa and recognized its value. One writer gives the method used as follows: "They chose out the best land; they dunged it and tilled it to the greatest perfection, and laid it out in beds, as for asparagus, and sowed the seed very thick, for the practical reason of enabling the plants by their thickness to better kill the weeds. The beds being harrowed very fine before sowing, which was at the end of April, the seed required to be speedily covered, lest the sun's heat should spoil it, but not with an iron tool, for the place must not be touched with iron."

Medica seed must be covered not with the plow, but with little wooden harrows. Some time after this, scratching was repeated with the same wooden instruments. They weeded it over and over, lest other grass should kill it while it was weak. The first crop they let stand until some of the seed scattered to fill the ground yet fuller of plants. After that it could be cut as young as they pleased, but they must be sure to water it often after every cutting. This was done largely by slaves, as was the weeding. The weeding was repeated after each cutting, and by these methods four to six crops were cut each year for ten years.

The most interesting part of history is that part that has never been written, and if some old Roman had given full details of how alfalfa came into the agricultural system of Rome, how it was used and where and when, it would make much more interesting reading than Gibbon's long account of Roman degradation and fall. An old English writer, Tull, writing in 1733, says: "The English gardeners make £40 off an acre of asparagus with half the labor the Romans bestowed on an acre of Medica, but as the Roman empire was then in its glory and Rome the metropolis of the world where all the richness of the earth was drawn together, the price of hay may have warranted this great outlay of labor.

Again, the Romans had not only servants but plenty of slaves, for whom they had scarcely sufficient employment, and this might lessen the expense of this tedious method of planting and ordering the Medica. But when the Romans were brought down to the level of other nations, and were in danger of being made slaves instead of having them, and the lands of Italy came to be cultivated by Italian hands only, they found something else more necessary to employ them in than the scratching, weeding and irrigation of the alfalfa, and then labor being bestowed in getting bread for themselves, they substituted other grasses of more easy culture for the food of their cattle, and they were so bigoted to all the superstitions of their ancestors that they were content to lose the use of that most beneficial plant rather than cultivate by a new, though more rational method, when they had become unable longer to continue it by the old. And so superstition chased lucerne from the Roman empire."

In 1653 Walter Blyth in his book "The English Improver Improved, or the Survey of Husbandry Surveyed" advised the English farmer to try to grow La lucerne, a French grass which is an excellent fodder and should be experimented with as every day will bring forth something or other worth our embracement."

Thus for 2500 years it has been known that alfalfa is a valuable forage crop; for 150 years it has been grown on this contient and yet the great mass of American farmers have just began to inquire as to its value and methods of growth, and it is more than doubtful whether it would not remain unknown and ignored if the wasteful methods of American farming had not dissipated the store of protein and caused an emphatic demand for new and cheaper supplies. Verily, with all our alleged rapidity, we are exceedingly slow in some things, and if alfalfa has not yet "arrived" as things seem to indicate, it is time that it should. F. G. S.

Notes from New York.

Environments of the Farmer.—Barnyard Manure.—Farm Labor.

ED. HOARD'S DAIRYMAN:—The main ambition of the farmer is to bring up and educate his children, and at the same time by a system of economy and frugality lay aside something to support himself at the time when decrepitude and age denies him the strength to longer actively engage in his chosen vocation. Many times false ideas of that economy swerve him from the right, and in the end leave him far behind his ideal goal. How many a poor man is hampered by large mortgages, a numerous family, and poor buildings. Buildings suited to the methods and systems of a generation or two ago, entirely inadequate to the modern system of agriculture.

In reading the report of the creamery investigations that are being carried on in New York and elsewhere, I can picture the many men who are working under disadvantages almost insurmountable, who are bright, intelligent fellows, yet victims of circumstances and environments that are beyond their control. My sympathy goes out to them. The sanitary building, the modern machinery, the model dairy cow, or even the silo might mean to them a deprivation far greater than any gain they might have made thereby. What are any of these as compared to the welfare, comfort of the members of their families. They cannot be considered in the same light. Neither can they be called ignorant, because they don't subscribe to the farm papers. Their ideal may lie in another direction, and who can say that it is not as noble, as lofty as any one's.

If a man could only know how long he was going to live, why then he could many times arrange things differently. Now we will suppose that a man and his wife have saved say a couple of thousand dollars towards purchasing a home, and they can buy one that is desirable for five thousand dollars, but the buildings are poor, no not exactly poor but "old-fashioned." Would any sane man advise expending that two thousand dollars in modern buildings, with the uncertainty of life hanging over the bread winner? You can call me ignorant, old-fashioned or anything you like, but I will pay that two thousand on that farm for the protection of my wife and family, regardless of looks or what the people will say.

While I believe in good cows, comfortable stables and surroundings that look respectable, I don't believe in "stepping over a dollar to pick up a cent." It don't make $10 hay worth $15 to be stored away in a gambrel roofed barn, and the old cow will chew her cud as contentedly in a weather-beaten boarded barn as she will in one painted and decorated in all the colors of the rainbow. Don't be discouraged if you should find yourself in surroundings that are not quite ideal. Make the best of them and as circumstances will allow, improve them. Progress does not mean radical, but gradual change. Radical change is not apt to be true progress. Contentment brings happiness to the cottage, or the mansion, while discontent breeds retrogression, criminals and insanity.

I am reminded of the little boy who heard his brother saying his evening prayer and when he said: "Give us this day our daily bread," piped out: "Johnnie, strike him for pie."

There is one thing that I want to caution you about, and that is this: These improvements won't come to you. No one will make you a present of them. If you get them you will have to roll up your sleeves and make the sweat start from the pores and keep it running. If you get pie you must expect to work for it.

I went hunting once with an old hunter and after we got to the woods, I commenced to find fault with the "slash" that filled them and thought there could not be any game there, and he said: "Never mind, there are many fine rabbits hid under these old brush piles," and it was sure enough. Your buildings may not be quite so modern, your ideas about farm methods a little more antiquated than your neighbors and still you may be the best citizen in many other ways.

I want to encourage you, not censure you, toward getting together a better dairy of cows. It is to your interest to do so. It can't possibly benefit me any. I know men and so do you, lots of them who have worked hard all their lives and have nothing to show for it. Don't seem to spend their money foolishly either. Those men have my pity and sympathy. Would it be right to really call them ignorant? Sickness in their families, generosity toward the church and a multitude of other things make the "best part of them under the ground." Nice, modern buildings, horses and showy harnesses and carriages are mere matters of taste, superfluities, luxuries, not really necessities.

A neighbor a few days ago went to a partition sale and really desired a farm that was being sold, but thought that the price was too high, considering the changes in the buildings he desired to make, mere matters of taste on his part.

We are apt to go to extremes in some things beside the weather.

Joe Wing, of the *Breeder's Gazette*, is with us at the Institutes. He built on his farm in Ohio a round, wooden-hooped silo last season after the plans given in HOARD'S DAIRYMAN, and is now loud in its praise. It was built as an experiment in feeding steers for the spring market, and in winter lamb fattening and sheep feeding. Ten acres of corn only were put in, but this small amount—for the season proved—as everywhere bad for corn—has already fed 60 steers and 700 eight-months-old lambs for 70 days, and is not yet quite all fed. The gain of the lambs is remarkable, and the steers are fattening as never before on the corn crop, and he tells me that, as compared with other winters, the same amount of corn is easily giving him double feeding value.

He is so sanguine over the success, and in the face of strong prejudice in the past, that he will erect two big silos next year and increase his feeding operations correspondingly, and in this he will be joined by several of his beef-feeding neighbors. Mr. Wing is satisfied that the wooden hoop—endless girth—is the hoop of all hoops for the silo, and says now he would not put iron rod, or band hoops, on a silo if they were given him and put on gratis. A pretty good pointer for intending silo builders in 1903.

Jackson, Minn. JOHN GOULD.

The Experience of an Illinois Dairyman with the Condensing Factory.

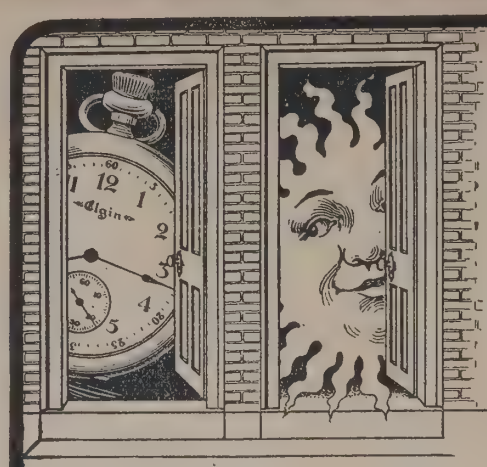
Recently, while riding on the cars to Chicago, we fell into conversation with an Illinois dairy farmer, who is a patron of a milk condensing factory. We found him to be a man of rare good sense, and his conversation was very interesting. As near as we can recall his words, they were as follows:

"I am a patron of a milk condensing factory and you know their rules about handling and feeding cows are very strict. At first, like all of the other farmers about me, I was a little inclined to rebel. I did not like the idea of their men inspecting my stables, the water supply, the kind of feed I fed and whether I kept my cows and stables clean. The truth was, we were all ignorant of what we ought to have known on these questions, and with most men, when they don't know, they don't want to know. I, like the rest, had made no special study of the sanitary side of milk production. We all thought that was mere book talk. None of us read a dairy paper or took any pains to know what we were about. I now see that we were all very ignorant of true dairy farming. I wonder sometimes how we got along as well as we did, but you see it was this way—there was really no demand that we should possess any better knowledge. But the condensing factory took that nonsense all out of us. They had no regard for our silly vanity or feelings. If we took their good money we must bring them milk that was made in the way they wanted it and so we swallowed our wounded pride when we were told that we must learn to do better, and went ahead. It was a grand school for us. Every man was brought face to face with the results of his own ignorance and stupidity, and made to see it, smell of it, and know it. For the first time in our lives, we were made to see that handling dairy cattle was really a work of brains. I think every dairy farmer ought to take a course for about six months under the rigid rules of a milk condensing factory. There is nothing like it to take ignorant conceit out of a man. I can see now how much it would have helped me if I had read and studied more on dairy questions."

There is a world of wisdom in what that Illinois dairyman said. There are thousands of farmers handling cows unprofitably, because they cannot bear to admit their own ignorance. We are all in the same boat to more or less extent. It hurts our vanity and conceit when we have lived among cows all our lives, to admit that we don't understand what we are about. But in a vast number of cases it is the straight truth nevertheless. There are poor, unsuccessful farmers in great abundance everywhere. Here and there is one who understands his business and he is very successful. What makes the difference? He understands his business better; that's all, and so he does better. Now, anything that helps us to understand our business; to look into it farther and deeper; to correct our blind conceit, that we know it all; that teaches us a knowledge of principles and how to apply them; that is the right school to go to. We can all remember certain boys when we were at school that the teacher could not teach. They had so much conceit and silly vanity that they could not see their own ignorance and need of a better knowledge. Some of those boys have gray hairs today, and keep cows, but like the Bourbons of France, they have "learned nothing and forgotten nothing."

It would give the cause of dairying a tremendous boost, if every creamery and cheese factory in the land was organized and run on the same principles that the condensing factory is run. A number of years ago we were called to a neighboring cheese factory to aid if possible in ferretting out what it was that was injuring the sale of the cheese over two cents a pound. We inspected every patron's milk as it came in, in the morning, and finally set one batch of nearly 1,000 pounds aside. The maker made up the balance of the milk and had a fine curd. This was done for two mornings and the result was the same. We then went to the patron whose milk had been set aside, and told him something was wrong on his place. At first he was inclined to resent the accusation, but finally consented to hunt it out with us. We found that his sole water supply for his cows was a foul sink hole in the pasture filled with the droppings of the cows. His milk was fairly reeking with this ferment. We persuaded him to dig a well, put in a wind mill, and after that there was no trouble. But this man was costing himself and every other patron a loss of over 2 cents a pound every day on 2,400 lbs. of cheese. Neither he nor his brother patrons thought it was worth their while to know anything about the "sanitary side of milk production."

Value per Pound of Butter Fat and Butter.



My creamery returns for part of November, read as follows: average price butter per lb., 21.80 cents; number pounds milk, 1,391; test, 4.5; number pounds butter fat, 62.595; net price of butter fat, per pound, 23.66 cents; net cash, $14.80.

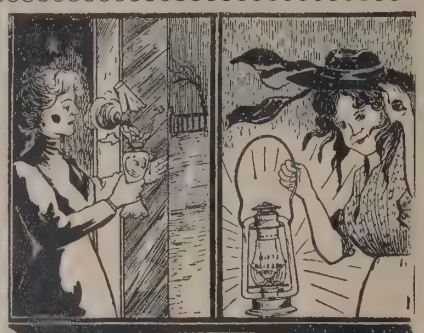
Can you tell how, with total expenses 2½ cents per pound for manufacture, butter fat figures out to be worth 1.86 cents more per pound than selling price of butter? H. H. B.

Hatley, Wis.

The best course to pursue in all cases of this kind is to apply to the creamery management for an explanation. As butter sold for 24½ cents the first week in November and went higher in succeeding weeks, we are of the opinion that the price given in the creamery statement is the net price, after deducting cost of manufacture. Otherwise there was probably some mistake.

A pound of butter fat will make about 1.12 pounds of butter, therefore the butter fat has a higher value than the butter. In the present case, if the butter fat is worth 23.66 cents, and there is an overrun of ⅛, then the theroretical value of the butter would be 21.4 cents per pound, but of course the actual market value might be slightly different as in the above case. The question of cost of manufacture does not enter into the above statement.

Next Door to the Sun



The timekeeping qualities of the Elgin Watch are perfect—next door to the sun.

BROWN'S BRONCHIAL TROCHES

Neglect of a Cough or Sore Throat may result in an Incurable Throat Trouble or Consumption. For relief use BROWN'S BRONCHIAL TROCHES. Nothing excels this simple remedy. Sold only in boxes.

"Practical Farmer", in the Wisconsin *Farmer* defines a balanced ration to be "a ration that can be fed with profit" and he says if it cannot be fed with profit "being balanced does not help it any."

That is a very unbalanced definition, and besides it is not practical, and coming from "Practical Farmer" does not help it any. In the first place he should have said "fed with the *best* profit." One may get a little profit even out of an unbalanced ration, providing the cows and the conditions are right. But to waste a good part of the profit, either because the ration is not well balanced, or because the cows are unfit for the work, or because the conditions (environment) are not such as good dairy sense would dictate, is to convict the man guilty of any, or all of these things, of not knowing the true principles of his business. And such a man is never a practical man.

Resolutions Adopted at the Annual Convention of the Wisconsin Dairymen's Association at Fond du Lac, February 11-13, 1903.

Resolved, That the Wisconsin Dairymen's Association, which for thirty-two years has been the recognized representative of the dairymen and dairy interests of the state, and as such, for many years has received annual appropriations from the Legislature (for two years past, four thousand dollars annually) to enable it to carry on its work of instruction and inspection, demands, as of right, that all imitations of and substitutes for dairy products shall be put upon the market under appropriate names, free from incorrect or misleading appellations or markings, and in such manner and form that purchasers and consumers may readily distinguish and recognize them as imitations or substitutes; and they especially protest at this time, that renovated, clarified and rechurned butter cannot with any propriety be denominated process butter, as though it was freshly made by some new and improved process, and should not be permitted to assume that or any other name or designation that does not clearly and unmistakably indicate its origin and character, and differentiate it from the regular product of creameries and dairies.

Resolved, That this Association unreservedly approves the legislation of Congress, and the regulations prescribed by the Secretary of Agriculture, relating to the manufacture and sale of renovated butter, as being just and right, conducive to commercial integrity, and in restraint of deceit and false pretenses. Every attempt to secure a modification of this legislation and the regulations for its enforcement, by the manufacturers of and dealers in renovated butter, is tantamount to an admission of a desire to deceive and thereby defraud the public.

Resolved, That this Association most heartily approves of the Bill now pending in the Legislature to promote the efficiency of the Dairy and Food Commission: that we endorse the stand taken by our honored president, the Dairy and Food Commissioner, to enforce to the letter the laws of the state relating to the sale of oleomargarine, and we request all judges, magistrates and prosecuting officers to give him their aid in this effort, and we cite the Association's record of more than thirty years' service in behalf of the dairy interests of Wisconsin, everywhere recognized as having been faithful, unselfish and efficient, as entitling its opinions and requests to favorable consideration by legislators and officials of every degree.

Resolved, That the thanks of this Association are due the railroads for granting to attendants at this convention reduced rates on the several lines.

Resolved, That in selecting Fond du Lac as the place for holding the 31st annual meeting of this association, the committee having the matter in charge made no mistake. The hearty, helpful interest taken in the convention by the Fond du Lac Advancement Association, the prompt attendance and close interest shown by the large body of farmers at each session from the first, shows that all classes of citizens here about are in sympathy and interested in the great work of this Association.

Resolved, That our thanks are due the officers for their unselfish devotion to the society and especially to our little band of traveling instructors who are doing better and better work as time brings experience and familiarity with its duties.

Resolved, By this convention of the State Dairymen's Association, That we approve of and request that the Appropriation asked for by the Agricultural College management this year, from the Legislature, be granted in full as being to the best interest of the whole people of the State of Wisconsin. And being it further

Resolved, That the secretary of this Association be and is hereby instructed to forward a copy of this resolution to the President of the Senate and to the Speaker of the Assembly of the State of Wisconsin,

A British Columbia Ration.

ED. HOARD'S DAIRYMAN:—Will you be good enough to give me a balanced ration from the following: My cows are grade Jerseys weighing about 1000 pounds. They are all fresh or will be by the time I get your answer. Bran, $24 00; shorts, $26.00; oats ground, $25.00; a mixture of ⅔ oats and ⅓ barley (ground) $25.00; and cocoanut meal, $32.00 per ton; oil cake cannot be gotten here and linseed meal is $6.00 a pound so I suppose that is out of the question. I want a ration from which I can get the greatest good for the money expended. I have lots of good hay of about equal parts red-top, clover, and timothy. Have also a few turnips but not enough to feed in large quantities. Can also buy good potatoes at $5.00 per ton, if it would pay me. The dealer told me when I asked him for an analysis, that it was pure cocoanut; some of the ranchers here think it is a good feed. Do you know anything about it?

One of my that cows came in last June, had a stoppage in the teat close up to the udder. There seemed to be nothing wrong with the udder, and by squeezing it, could force the milk through into the teat, but very slowly. She is a heavy milker and it would take about fifteen minutes to milk the one teat. Do you think it was carelessness in drying her off that caused it? If so let me know how you go about drying your cows up. I note in your issue of Jan. 2, page 991, you advise J. K. T. to use a bistoury and gave directions. Will this apply in my case? If so, where can I get an instrument, and what are they worth? E. H. B.

Chilliwock, B. C.

Cocoanut meal is not used in this part of the country, but, as stated by our correspondent, it is very much in favor among the dairymen on the Pacific coast. We therefore suggest that our correspondent try the following formula:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
20 lbs. hay	17 06	.96	7.92	.32
2 lbs. cocoanut meal.	1.79	.31	.77	.21
4 lbs. oats	3.56	.37	1.89	.17
2 lbs. barley	1.78	.17	1.31	.03
Totals	24.19	1.81	11.89	.73

We are well aware that the digestible protein in a ration of this character is much below what was deemed necessary only a few years ago, but repeated experiments seem to show that the amount stated is sufficient, at least to secure a good flow of milk. Just what the effect will be on the progeny and the future usefulness of the cows themselves has not yet been determined.

If the stoppage is caused by a film between the lower milk cistern in the udder and the milk channel in the teat, as is sometimes the case, a large knitting needle, thoroughly sterilized and well greased, may be used for puncturing it. This is not as good an instrument for the purpose as the bistoury, but frequently answers the purpose. Of course a layman in a case of this kind should proceed very cautiously. We do not think the trouble was occasioned by any carelessness in drying up the cow, and we do not feel called upon to hazard any guesses as to what may have been the cause.

"ADVERTISEMENT."

BUILDING BONES.

Of Great Importance that Children Have Proper Food.

A child will grow up with weak and small bones or strong and sturdy frame, depending on the kind of food given.

That's why feeding the youngsters is of such great importance. The children do not select the food—the responsibility rests with the parent or guardian, or with you if you select the food for a boy or girl.

The scientific selection of this food should begin as early as possible. That's when the delicate little plant needs the tenderest care. A well known lady of Chlistoga, Calif., says: "About two years ago my little niece was taken sick. When medical aid was called one physician pronounced the case curvature of the spine; another called it softening of the bones and gave but little hope of her recovery. For weeks she had been failing before her parents thought it anything but trouble from her teething.

"She had been fed on mushes and soft foods of different kinds, but at last her stomach could retain scarcely anything. At this time she had become a weak little skeleton of humanity that could not much more than stand alone.

"The doctors changed her food several times until finally she was put on Grape-Nuts which she relished from the first and ate at almost every meal and her recovery has been wonderful. She has been gaining ever since in strength and weight.

"She has eaten dozens of packages of Grape-Nuts in the last year and a half and the child is now a rosy-cheeked and healthy little girl, still clinging to her Grape-Nuts.

"It is plain the food has saved her life by giving her body the needed material to keep it well and the bone material to build with. Name given by Postum Co., Battle Creek, Mich.

Empire Empire

Eight Years

The Empire Way Makes Cows Pay.

Fifteen Cows

1895 1896 1897 1898 1899 1900 1901 1902

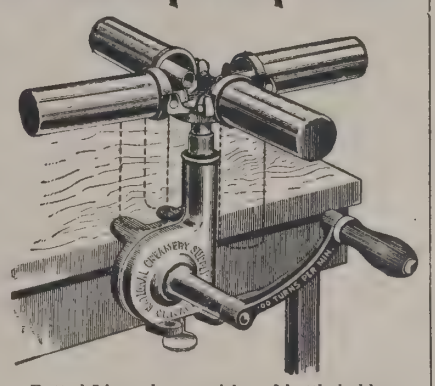
How's This for a Record?

Emporia, Kans., Jan. 2nd, 1903.

Empire Cream Separator Co., Bloomfield, N. J.

Dear Sirs: Have used one of your **Empire** Cream Separators for the past eight years, during which time I have been milking at all times from twelve to fifteen cows. The cost for repairs in the eight years has been only seventy-five cents. I have had experience with other separators but consider the **Empire** superior to any other, as it never caused me any bother. It is easy to clean and has proven very durable. It does good work at all times. L. H. VAHSHOLTZ, Rural Route No. 4.

The Empire Cream Separator turns more easily, is more easily cleaned, does better work, and costs less for repairs than any other, because it is the **simplest separator made.** Don't buy a separator until you have investigated the merits of the Empire.



Send for our new book on Making Milch Cows Pay.

Empire Cream Separator Co., Bloomfield, N. J.

Western Office—FISHER BUILDING, CHICAGO.

Eight Years 75 cents for Repairs Fifteen Cows

NATIONAL
Babcock Milk Tester

Dotted Lines show position of bottle holders when not in motion.

Has enclosed cut gears.
Swinging bottle-holders.
Runs without jar.
As well made as a cream separator.
Best tester for dairymen ever made.

The weight of machine when boxed, approximately 11 lbs.

DOES YOUR DAIRY PAY?

It costs no more to feed a profitable than an unprofitable cow.

NET PRICES:

No. 1,—2 bottle, complete for testing milk.... each $4 00
No. 2,—4 bottle, complete for testing milk.... each 5 00
No. 3,—2 bottle, complete for testing cream and milk, each..... 4 50
No. 4,—4 bottle, complete for testing cream and milk, each..... 5 50

Prices include full directions for making test, bottle of acid, test bottle brush, acid measure, pipette and test bottles.

We are the great Dairy Supply House of the West. We carry an immense stock of all kinds of Butter and Cheese Making Apparatus and Supplies. Write for catalogues and circulars.

National Creamery Supply Co.,
450-458 Illinois St.,
CHICAGO, U. S. A.

Cream Separators
THE
Improved International

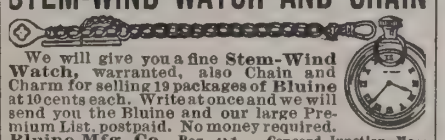
The best in the world, has no superior if you want a larger butter yield. It runs easily, skims clean, and is easy to wash. It is perfect in mechanical construction and magnificent in appearance. No outside gears to catch your hands and clothes. Only three parts in the bowl. Look at the low supply can. All parts absolutely interchangeable. Write for Catalogues and Prices.

Chicago Office,
GEO. A. ELDER, Gen. Agent,
Tacoma Blk, La Salle & Madison Sts.,
CHICAGO, ILL.

THE INTERNATIONAL CREAM SEPARATOR CO.,
LANCASTER, PA., U. S. A.

No farmer or dairyman can afford to be without one.

PRICE $30 UP.



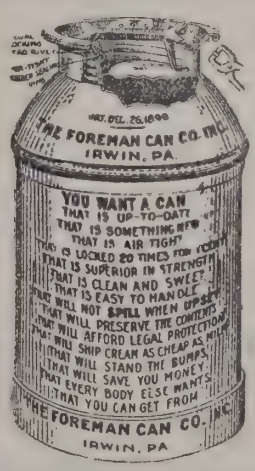
Write for Booklet.

TEN DAYS FREE TRIAL
THE ECLIPSE
Cream Separator

We want to send you an *Eclipse Cream Separator* to try. It is built double strength all through and will last and work perfectly for a life-time. It acts twice on the milk and **skims it absolutely clean.** Its interior device is simple, easy to wash and to operate. Its double process removes filth from the milk as well as separating the cream, and leaves both pure and sweet and fresh. It never gets out of order. It is guaranteed. It's a money maker and a money saver. It operates by hand, foot or motor power.

C. L. CHAPMAN CREAM SEPARATOR WORKS, ERIE, PA.

STEM-WIND WATCH AND CHAIN



We will give you a fine **Stem-Wind Watch,** warranted, also Chain and Charm for selling 19 packages of Bluine at 10 cents each. Write at once and we will send you the Bluine and our large Premium List, postpaid. No money required.
Bluine Mfg. Co., Box 91, Concord Junction, Mass

A Handsome Book
About Mandolins, Banjos and Guitars, Free.

Any one interested in the subject of mandolins banjos and guitars can obtain a beautiful book about them free by writing to Lyon & Healy, Chicago. It contains portraits of over 100 leading artists, together with frank expressions of their opinion of the new model Washburn Instruments. Descriptions and prices of all grades of Washburns are given, together with "Facts about the Mandolin" and "How to Play the Mandolin."

LYON & HEALY,
100 Adams St., Chicago, Ill.

Washburns are sold by leading music dealers everywhere.

We wish to announce that we are now operating our new factory at Irwin, Pa. Capacity—1000 cans daily, which should enable us to fill all orders promptly.

Every can sold on a guarantee. Write for Circular H.

STEEL ROOFING
FREIGHT CHARGES PAID BY US

Strictly new, perfect, Semi-Hardened Steel Sheets, 2 feet wide, 6 feet long. The best Roofing, Siding or Ceiling you can use. No experience necessary to lay it. An ordinary hammer or hatchet the only tools you need. We furnish nails free and paint roofing two sides. Comes either flat, corrugated or "V" crimped. Delivered free of all charges to all points in the U. S., east of the Mississippi River and North of the Ohio River

AT $2.25 PER SQUARE

Prices to other points on application. A square means 100 square feet. Write for free Catalogue No. 20.

WILL IT PAY YOU TO TAKE HOARD'S DAIRYMAN?

W. H. Jenkins took a census in 1901 of 50 farmers who were patrons of the creamery in Montrose, Pa. Twenty-five of them read dairy papers; twenty-five did not. The twenty-five who did read dairy papers averaged $50.23 per cow for the year. The twenty-five who did not read averaged $32.95. Here is a difference of $17.28 per cow. Did it pay the twenty-five to read? Did it pay the other twenty-five not to read? That's not all. Those who did read averaged a profit over cost of food of $15.06 per cow. Those who did not read averaged a profit of 66 cents. Is not that dairy farmer standing greatly in his own light who will not pay 2 cents a week for Hoard's Dairyman? These are hard facts worth thinking over.

We are receiving of late a good many requests for a bundle of copies of HOARD'S DAIRYMAN for distribution. We are very glad to forward copies for distribution, for we need the help of every reader to increase the circulation of the DAIRYMAN. Get up a club of subscribers among your neighbors. If there is going to be a meeting of the creamery or cheese factory patrons, write us for a bundle of sample copies for distribution. If you are going to a farmers' institute, have some copies with you. These meetings afford excellent opportunity to work up a good club. Write us at least a week ahead of the meeting saying how many copies you want and we will promptly forward. Give us your help.

KANSAS AGRICULTURAL REPORTS.

At regular intervals there comes from Kansas reports and monographs bearing witness to the industry and agricultural judgment of the state secretary of agriculture, F. D. Coburn. It is not saying too much when we state that these reports are of great and permanent value; that they stand at the head of all reports of like nature, and that the state of Kansas is to be congratulated on her secretary of agriculture and his reports.

Out of the great mass of agricultural literature published each year in the United States there is much good and perhaps a larger amount that is useless, and from this mass Secretary Coburn has carefully selected such matter as is, in his opinion, applicable to Kansas conditions and valuable to Kansas farmers.

The result is as might be expected, and we see no indications that Secretary Coburn is failing to keep up to his previous high mark.

The present report is devoted mostly to the beef breeds and wheat growing, with lesser discussions on hogs, alfalfa and corn. The only blot on the escutcheon is the want of a general index, which we hope to see supplied in future volumes.

A STRONG DAIRY CONVENTION FEATURE.

There was no topic in the entire programme of the late Wisconsin Dairy Convention at Fond du Lac which produced the intense interest that did the address of C. P. Goodrich on the "Cow Census," which was taken under the direction of the Association and which was published in the DAIRYMAN of February 13th.

Here was a close, careful analysis of the cold, frozen facts concerning the intelligence, the methods and the management of 48 creamery patrons and 12 cheese factory patrons living within a short distance of the town where the convention was held. Consequently it gave a strong local interest to the work of the convention and brought out and maintained for three days a large attendance of the dairy farmers living in that portion of the state. That is just what is needed at all dairy conventions and farm institutes. The same course was pursued by the Association at its convention in Menomonie last year, and we can safely assert that no work that the Association has ever done has proved as strong in its lasting effects and in inducing a good attendance as this "Cow Census" feature.

The DAIRYMAN would suggest to the officers of Dairy Associations in other states that they make provision for the taking of similar censuses in the neighborhood of their conventions for the coming year. They will hear farmers say as we did repeatedly, at both Menomonie and Fond du Lac: "Well, there is something you can learn from. I would not have missed that for anything." The prime object of these dairy conventions and farm institutes is to get hold of the attention and reach the conviction of the farmer. It is often quite difficult to get them to attend. Somehow they do not feel interested, nor do they clearly see how such a meeting is going to be of any help to them.

But let it once be known for a few weeks previous, that a "cow census" has been taken and that a sharp, clear and truthful account for the year, of, say, 50 herds and farms, will be laid before the meeting and the room will scarcely hold the attendance.

The census is hardly practicable except where a cheese factory or creamery is in the case, so that the cash receipts of each person for the year can be authoritatively stated. In this there is no guess work. Taking the farms by number, omitting the names, leaves out all chance for personal sensitiveness and feeling, which is a good thing.

A PROPHECY FOR THOSE WHO ABANDON DAIRYING.

In sending us his most excellent address delivered before the Nebraska Dairymen's Convention on "The Special Dairy Cow in Nebraska," the author, Mr. J. F. Schlappi, has the following note of warning to utter to those young farmers who forsake dairying because they want an "easier job." It is always safe to say, "look out," to any man in the prime of life, when he gets lazy and begins to shirk labor and care. As a rule, he has started on the easy, down-hill road. Mr. Schlappi says:

"I cannot overlook Brother Wallace of Wallace's *Farmer* when he said in one of his recent articles regarding the decline of dairying in Iowa, that the fathers had paid for the farms by dairying, but that the young men, their sons, were well enough fixed and did not need to follow the confining occupation of dairying. It is my opinion that these same young men will find themselves the slaves of extravagant habits, and, if not sold out by the sheriff, they will find themselves the possessors of exhausted farms."

There are hundreds of thousands of examples in the eastern states to confirm the wisdom of Mr. Schlappi's warning. No one, not even an angel from Heaven, could convince those young, eastern farmers 40 years ago that they were pursuing a suicidal course. They turned their backs on the teachings of science and said in effect "the wisdom of ignorance is greater, yea, far greater than the wisdom of those who can render reason." Why should not history repeat itself in Iowa and Nebraska?

A BRIGHT FUTURE FOR THE BRIGHT FARM BOY.

A great many rich men in the United States are very fond of the soil. They love to have fine farms, handsome buildings, the finest of horses, cattle, sheep and swine. It gratifies both their taste and their pride to ride over their landed estate and feel that they are engaged in the most aristocratic of all callings, that of land owner and farmer.

There is a deep laid instinct for ownership in the soil, that exists alike in the hearts of the poor and the rich. But of all property ownership the farm is the most hazardous unless it is supervised by intelligence and practical judgment. Most of the wealthy owners of farms have but little, and in many cases none, of this judgment. They must depend upon hired superintendents. It is a difficult thing for any man, no matter how honest, to serve another whom he knows has no knowledge of when he is well or ill served. Human nature is weak at the best, and it is an old and true maxim that but "few men do any better than they are obliged to."

A great Polish nobleman who had large estates said:

"There are two kinds of stewards: he who thinks only of himself, and he who thinks of himself and us; happy the land owner who lays his hands on the latter. As for the steward who thinks only of us, he is not to be met with."

It is very evident then that every wealthy owner of a farm owes it to his own interest that he make a serious study of the problems of the farm. He must know thoroughly and well not only his side of the question, as an employer of labor and skill, but he must know the hired man's side of it as well. There is rapidly springing up a new department of labor, that of superintendent of farms. All thoroughly well equipped Agricultural Colleges are turning their attention to the supplying of this demand. At the present there are a hundred wanted where one can be found. The whole country is waking up to a knowledge of the value of real scientific, brain farming. The man that is wanted for the management of these great farms must be thoroughly schooled and trained in the knowledge of what science can do for the farm. He must also be active, and absolutely honest, more so even, than a bank clerk. More than this he must have a broad and well balanced judgment of soil, crop, and farm animals. But still more he must be a good judge of human nature, a tactful manager of men. In most cases such men are farming for themselves, but here is a field for the ambitious farm boy who wants to make the largest possible kind of a man of himself. There is no danger of overdoing the thing. The supply will for years fall far short of the demand. Besides what the school and books can give the young man who is seeking this field of labor, he should spend two to four years in the employ of first-class farmers who employ the best of modern farm methods, and thus learn the art of first class farm management.

PLEASE READ AND CONSIDER.

We present this week the final table and letter, on page 60, of the "Cow Census," taken by Mr. Jenkins concerning 45 patrons of the Onondaga Co., N. Y., Milk Association. The last two columns of the table tell a mighty important story, the story of profit or loss on every dollar invested in feed, and whether the farmer lets any light or not into his mind. Read the conclusion that Mr. Jenkins sums up on page 61.

What a powerful comment it is on the doctrine HOARD'S DAIRYMAN has been preaching all these years. Thirty-one of these men read agricultural papers; fourteen do not read. The average increase in profits of those who read over those who do not read is 15 cents on every dollar invested in feed, or $6.40 per cow, and on a dairy of 20 cows, $128 more than the man who does not read.

What a comment that is on the constant talk of those men who say: "I can't afford to spend one dollar a year for instructive reading." The cold facts tell a different story.

Temperature of Drinking Water for Cows.

ED. HOARD'S DAIRYMAN:—Having noticed in your paper on page 1075, where a brother farmer asked the temperature we would advise for cows drinking water, and as I have heated water for cows to drink for the last 20 years, and have endeavored to ascertain what I thought was the best, I will say a few words in regard to my experience. After trying many different degrees I find about 80 degrees about what pleases the animal the best. For at that point the cow will put her head down and commence to drink at once; and after giving water at that point for a few days, if it is a little colder she will hesitate, and at 40° will not drink at all until compelled to by thirst.

"But," says one, "why do you want water as warm as that?" Because the cow must heat the water up to 98° before it goes in the milk pail, so if the water is up to 80 she is not compelled to raise it but 18 degrees, but if it is down to 40 she is compelled to raise it 58 degrees, and she has no means to warm the water only by the food she consumes, therefore the food she consumes to heat this water cannot be used to produce milk.

Now after looking at it from this point how can we expect a cow going to a brook after a little ice water once a day, and the remainder of the day eating dry food and then give a large flow of milk.

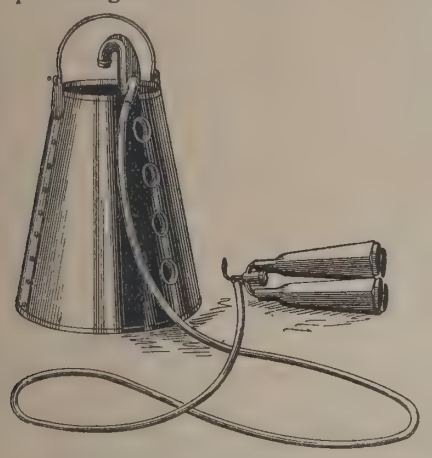
After a cow has taken enough ice water to last her 24 hours it requires some time for her system to warm up to 98° which it must be before she can use it. Still after she has taken this water some compel her to stand out of doors for an hour or more in the cold air. They claim for exercise, when in fact she comes directly back to the barn and stands still for her master to leave his warm fire and come to let her in where she can get some food to warm her system. All the means she has to produce heat and to warm this water she has lost while standing in the cold air. Now how can we ask a cow to do this and then give a large flow of milk. Still the master thinks he does this for the good of the animal, but this is not the case.

Now I want my cows to stand for the 24 hours where the mercury stands at 70°, the water is heated to 80°. All this I can do by a system I can explain and the same system will ventilate the barns perfectly so the air will be pure for the 24 hours at a cost not to exceed 50 cents per cow for the entire winter for 30 cows.

I do not advance these ideas for some one to try at his expense and my profit. But as I have said before if they are not worth much they cost nothing. But nevertheless they are truths I can easily prove, for I have proved them for the last fourteen years. NORMAN BROWN.

West Berlin, N. Y.

The Sharples Milking Machine.



ED. HOARD'S DAIRYMAN:—The matter of a mechanical cow milker is one of deep interest to all dairymen. Many attempts have been made in this line, but for some reason all efforts heretofore have failed to produce a milker that was satisfactory. For two years past rumors have been current that the West Chester, Pennsylvania, Sharples separator people were working on the problem. A week or two since an advertisement appeared in the DAIRYMAN calling the attention of the public to the Sympathetic Pulsating Lactator, and there is hope that the knotty problem has at last been solved.

Mr. Sharples writes of his milker: The mechanical devices put on the market

have been mostly of two classes. One of them extracted the milk by suction only, and while it might do reasonably well on a hard milking cow for a season, it very soon makes the teats sore on an easy milker and its use has been abandoned, because there was no method to regulate the work. The other plan is to extract the milk by mechanical compression of the teat, and it will not work successfully. No two teats are alike in shape, and a mechanical contrivance can not be produced that will fit all of them.

The calf is the best cow milker that was ever invented. It combines both of the above methods, and in addition pulls hard on the hard milker and lets up a little on the easy one.

The Sympathetic Pulsating Lactator, manufactured by the Dairy Specialty Co., of West Chester, Pennsylvania, has used the motions of the calf as a copy. It works hard on some of the cows, and is quiet and gentle on others.

MILKING MACHINE AND BUCKET

The machine can be used to best advantage with a dairy of fifty cows or over, as it requires an engine or other power to drive it. A vacuum air pump is located at some nearby point convenient to operate it. From this a line of iron gas pipe is run above the cow stalls in the milking shed. The only service of this pipe is to exhaust the air in the milk bucket, no milk or other liquid being run through it. A small branch is fitted over each stall, and is formed into a hook on which the milk bucket hangs, a foot or two above the cow's back.

The bucket is air tight, the top being closed with a lid which is clamped securly into place by the simple act of raising the handle to lift the bucket. The mere hanging of the bucket on the hook is all that is needed to make the connection with the air pipe.

The teat cups are seen on the right hand side of the picture attached to a rubber tube, and in the center of them a small valve no larger than a hen's egg where all the regulating is done automatically. A turn of the handle under the valve sets the machine to work, and the resulting suction holds it in place until it is removed after the milking is finished. The valve and teat cups weigh but 33 ounces, and one man can use four or five of them to advantage on a string of cows. By the time he has the fourth one in place the first has finished its work and is ready to put on a new cow. In this way one man can readily do as much work as four milkers, and do it more satisfactorily to the cows and to himself. The cows do not object, but seem to enjoy the operation. The machine is easy to wash. When work is done, clear, cold water is sucked through it a few minutes and it is set away to dry. All the parts of the buckets and milkers are easily accessible and can be washed with a brush if desired.

The sympathetic action of the pulsator is the vital feature of milking never before attained mechanically. All milking machines have previously treated one cow just as another, and have failed to respond to their individual peculiarities. The sensitive, easily milked Jersey and the big, beefy Short-horn have been treated just the same, but the Lactator works on each cow differently, according to her individual characteristics. The teat cups are new and novel in their action. The cup is so constructed that it collapses at the top first, and after compressing the root of the teat follows down and strips the milk from the rest of it. The use of the machine makes much cleaner milk. It cannot get dirty; the cow has no chance to kick the bucket over, nor can the operator wet his fingers in the milk. As it is drawn from the cow the milk is in an air tight bucket and entirely free from contamination by the foul stable odors. It is carried from the stable in this bucket, and will keep sweet much longer than under ordinary circumstances, for the bacteria have no show at it in the stable.

The machine when in operation makes little noise—only a pulsation each time it takes a new breath. The harder the cow is to milk the harder and longer is the breathing, this being regulated automically. It takes from 2½ to 10 minutes to milk a cow, and one man can readily handle fifty of them. The machines are not expensive, and can be operated by any farm hand of ordinary intelligence. They milk a cow clean, and do not have a tendency to dry up the flow.

THE SHARPLES CO.

Boric Acid for Sore Teats.

ED. HOARD'S DAIRYMAN:—I notice in your Veterinary department many reports of sore, chapped and otherwise damaged teats. I have also had lots of trouble from the same cause, until some months ago, when as a sanitary measure only, I inaugurated the use of a solution of boric acid to wash the milkers hands and the cow's udders before milking. In a few days after we started this practice all soreness, chaps, etc., disappeared and we have had no trouble of that kind since. Of course I know boric acid is an anti irritant as well as an antiseptic, but the value of it as an anti-irritant did not occur to me until it had proven itself. F. N. B.

Plan for Horse Barn Wanted.

Would you kindly give me a plan for a horse stable, 30×40 feet. I already have the barn, which it is proposed to place upon a stone foundation, raised the full height of the stable at the corners, but only four feet the rest of the way, so as to avoid having a basement stable, which I have supposed objectionable. The driveway of the barn is twelve feet wide, in the center; and I would like a passage (or two) by which a horse may be led between the stable and the driveway above. READER.

Wauwatosa, Wis.

As there are no specifications as to the number of horses to be provided for, it is not practicable to submit any very definite suggestions in reply to this inquiry. It would not be a very difficult matter to build an inclined plane running from the floor above down to the stable, but the probabilities are that it will have to be built with a turn, and if so it would occupy too much space to build two such passageways.

An Ontario Ration.

Could you formulate a balanced ration for cows weighing about 900 lbs., half bred Jerseys, out of the following: Bran, shorts or middlings, pulped mangels and well saved corn fodder cut. Also, would you advise mixing the pulped mangels and cut corn together and mix the bran and shorts in them, or feed the bran and shorts by themselves, dry or in a slop? H. E. W.

Keyser, Ont.

We are of the opinion that 30 lbs. of mangels, 8 lbs. of middlings, and 25 lbs., more or less, of corn stover would make a very satisfactory ration for this Ontario inquirer.

We would not mix the pulped mangels with the corn stover, because, do the best one can, the cows will leave more or less of the hard, dry pieces of the corn stalks. We would, however, mix the mangels and the middlings and add a teaspoonful of salt to each feed, night and morning. If in use it should prove that the middlings in this mixture become too pasty and too sticky, we would substitute 4 lbs. of bran for 4 lbs. of the middlings.

Which Breed of Cows for Milkmen.

There is another question on which I would like very much to ask your advice. What breed of cows would you prefer for supplying a retail milk trade? Some cream is required, but not a great deal; yet the quality of the milk must be good. We raise about half a dozen calves each year to keep up the herd, and could soon work into the most desirable breed. So far we have endeavored solely to get good individuals, and have not had the best of success. READER.

Wauwatosa, Wis.

Judging from what we know of the practice of several dairymen, who keep large herds for furnishing city milk, we are of the opinion that it is not desirable for milkmen to bind themselves to any one particular breed. It is pretty well recognized now, that, except for special trade, it is not most profitable to limit oneself to cows which produce milk carrying more than about 4 per cent fat. No one can successfully combine a milking herd for a retail trade with a breeding herd. There are many heavy milking cows among Jerseys and Guernseys, giving milk testing between 4 and 5 per cent, and there are a good many Holsteins giving milk which will average well up to 4 per cent or a little above.

A Wisconsin Ration.

I have at present 15 fresh cows, grade Holsteins; six are heifers with first calf. Wish you would make me up a ration of the following feeds: For roughage I have shredded corn, with most of the corn in it, rather moldy. I consider it very poor feeding; my neighbors, however, think it is all right; they seem to think shredded corn must be moldy. All that I have ever seen was moldy. Let me know what you think about it. I also have common red clover hay and oat straw mixed with pea vines. For concentrates, I have oats and peas mixed, which are worth 35 cents per bushel, 32 lbs.; bran costing me $16 per ton; linseed meal, $28 per ton. Would it pay me to buy corn at 50 cents per bushel, 56 lbs., and sell the oats and peas at 35 cents; also have rye at 45 cents, 56 lbs., and barley at $20 a ton? W. W.

Woodland, Wis.

We suggest that this inquirer use as an average 10 lbs. clover hay; 10 lbs. oat and pea straw, 6 lbs. bran and 1 lb. oil meal.

Moldy forage of any kind cannot well be recommended for use, but when one has it, it is perhaps asking too much to advise that he should throw it away; but it must be used with caution, and if it can be fed to anything but milch cows so much the better. Of course the degree of mold has much to do with its feeding value, or the propriety of feeding it at all. If only slightly moldy probably no injurious effects would be noted. As will be seen from our suggestions above we think the peas and oats might be better sold at the price named than fed. The combination would be but little better than bran, and the price very considerably more.

At the Dairymen's convention, at Fond du Lac, February 11-13, Mr. W. D. Howie, Jr., of Sunny Peak Farm, reported very satisfactory returns from feeding boiled rye to the thoroughbred Jerseys which constitute the dairy herd on that farm.

Alfalfa Seed.

W. W. of Woodland, Wis., writes that he intends sowing about five acres of alfalfa this spring, and as there are different varieties, wants to know which we would recommend.

So far as we are advised there are practically only two distinct varieties of alfalfa now grown, the common alfalfa and the Turkestan alfalfa. The Turkestan alfalfa is of recent introduction and the seed is not generally on the market. We presume alfalfa seed can be had from any of the seedsmen whose advertisement appears in the DAIRYMAN. The John A. Salzer Seed Company of LaCrosse, Wisconsin, claim to be making a specialty of alfalfa seed this season. It would be a good business practice to write to this company, and to others, for that matter, for catalogues, prices and other pertinent particulars.

Some Cream Questions.

I separate my own cream and take it to the creamery. Does it make difference in the test of my cream if the creameryman takes a sample of my cream for testing once a month or every other day when I deliver it? Does old cream or new cream test the highest? D. G.

Alum Rock, Pa.

If composite samples are used, the testing should be done once a week at least. If no composite samples are taken, the testing should be done every day. If the samples of cream are weighed, there should be no difference in the accuracy of the test, whether old or new cream is used. If the samples are measured, old cream will test lower.

A Wisconsin Feeding Inquiry.

Will you let me know if I could better my feeding by any change. I have ten cows, all fresh late in fall and winter; getting from 20 lbs. to 45 lbs. per day per head. Am feeding shredded stalks night and morning, timothy hay once a day, from 6 to 7 lbs. of bran per day and 1 lb. oil meal. Would it be better to grind some corn to go with it? Bran, $18 per ton; oats, 31 cents per bushel; oil meal, $29 per ton; corn, $12 ground with cob.

Wisconsin. E. R.

Where roughage is limited to corn stover and timothy hay, there is not much opportunity for feeding corn with profit. In the present case it may be a query whether the oats would not be cheaper than bran, or possibly a combination of oats and bran and oil meal would give best results. We are disposed to think that the oil meal might be increased somewhat and if oats are mixed with bran less than the amount now given would suffice. Five pounds of a mixture of bran and oats with from 1½ to 2 lbs. of oil meal, with stover and timothy hay *ad libitum*, should make a fairly satisfactory ration.

A New York Ration—Silage and Abortion.

If you would please give me a balanced ration from the following, I would be much pleased. We have on hand about one hundred tons of good silage, ten tons of very fine timothy and clover hay, about the same of timothy without any clover which can be sold for $18 in city, also twenty tons of the same timothy that is overflowed and is very dusty and muddy which cannot be sold and which will kill the cows if fed to them. Wouldn't it be all right if shaken out well and sprinkled? Can get bran for $20; gluten meal, $25; corn meal, $22; brewers grains, 10 cents per bushel in winter and 5 cents in summer, or could get anything else you would advise to make up the balanced ration.

We had fourteen abortions in our dairy the past summer and fall, and would ask if you think it possible that the silage produced it and would you advise feeding the balance of the silage that was left in the silo from last year when we come to it, if you think that was the cause? D. H

Elmira, N. Y.

This inquirer states in an unpublished portion of his communication that after leaving the High School, he entered an office and remained there for five years. All this time he had a farm of some 200 acres that did not seem to return any profit and he has concluded to make a little trial at dairying under his personal supervision, taking a portion of the herd into his own care.

We do not think the damaged timothy hay is fit to be fed to cows. And even if it does not produce bad effects, it is of so little feeding value that it would not pay to demand that a cow, in addition to giving milk, should furnish the energy required to digest and assimilate what little nutritive value may be left in such roughage. Just what to do with it is perhaps a serious problem. Possibly it might be well shaken out and fed in limited amounts to young stock, dry cows and strippers. They could pick it over and select out the best morsels and what was left would perhaps make a very good addition to the manure.

If the cows to be experimented with are fresh milkers or nearly so, we would advise feeding them a daily allowance substantially as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates	Ether Extract
40 lbs. silage	10.56	.52	5.60	.28
6 lbs. clover and timothy hay	5.12	.29	2.38	.10
20 lbs. brewers wet grains	4.86	.78	1.86	.28
4 lbs. ground corn	3.56	.32	2.67	.17
Totals	24.10	1.91	12.51	.83

It will be seen from the above that we take no stock whatever in the theory that abortions are in any respect due to the silage. The present writer has fed silage to his cows for some twelve years, and thus far has been unable to detect any unfavorable effects in any direction. We do not feed decayed and moldy silage. It is but fair to state that some very well posted dairymen do not fully agree with us on this subject and deem it prudent at least, not to feed silage to cows when in an advanced state of gestation. It is not a question of the age of silage, but of its condition. If it is sound, it does not matter whether it is one or five years old.

Blood Meal.

A subscriber at Grass Lake, Mich., asks whether the Editors or any of their readers can give any information regarding the use of blood meal, containing 87 per cent protein, in feeding dairy cows.

The Editors have to admit entire lack of experience in this line and would be glad for information on the subject from any of their readers who have had experience. The Senior Editor is experimenting with this product in connection with skim milk for calves, and is very well pleased with the results thus far. Dried blood was used in a feeding experiment with steers in Iowa last year, commencing with one-tenth of a pound per head, per day and gradually increasing until the steers were each receiving a full pound per day, in connection with 15 lbs. of corn gradually increased to 25 lbs. of corn meal per day. There would seem to be no reason why this dried blood might not prove a very acceptable addition to our list of dairy feeds, and perhaps could be fed, by commencing very moderately, up to half a pound a day.

An Ohio Ration.

Please formulate a balanced ration for milk for city trade from bran, $20 a ton; gluten meal, $30; oil meal, $28 and some ear corn; cows fed corn fodder and clover hay, the latter $10 to $12 per ton; cows from 700 to 1,000 lbs. Please say how much grain by quart measure, and how much hay by weight, fodder per bundle. A. H.
Toledo, Ohio.

We must beg to be excused from attempting to give amounts to be fed by measure, although in practice, except where careful experiments are being conducted, measures are used for apportioning the feed; but the careful feeder always checks himself by frequent weighings of the quantities as measured out, and if necessity for doing this in any case prompts a dairyman to provide himself with scales, there will be another point of advantage gained.

There is a very wide difference between fodder corn and corn stover, although the stover is very frequently termed corn fodder. Assuming that our correspondent means corn stover (corn stalks) we suggest that he try the following formula:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
12 lbs. clover hay.....	10.16	.82	4.30	.17
10 lbs. corn stover....	5.95	.17	3.24	.07
2 lbs. oil meal.....	1.82	.59	.65	.14
2 lbs. corn and cob meal.....	1.78	.13	1.26	.07
4 lbs. bran.....	3.52	.50	1.54	.12
Totals.....	23.23	2.21	10.99	.57

A Mississippi Ration.

Please formulate me a ration for my herd of dairy cows, grade and thorough-bred Jerseys, Cows should give 2½ to 3 gallons milk per day. Cotton seed meal, $21 per ton: wheat bran, $20; cotton seed hulls, $5; Johnson grass hay, $10; corn meal, $29.20. Have limited quantity of pea hay worth, perhaps, $12.50. C. C. B.
Starkville, Miss.

We suggest in this case a trial of the following formula:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
10 lbs. Johnson grass hay.....	8.77	.24	4.78	.07
5 lbs. cow pea hay...	4.47	.54	1.93	.06
5 " cotton seed hulls	4.45	.02	1.66	.09
2 " cotton seed meal	1.84	.74	.34	.17
5 " bran.....	4.41	.63	1.93	.15
Totals.....	23.94	2.17	10.64	.54

Of course if the limited quantity of pea hay does not permit feeding 5 lbs. per day we would feed less of it and increase the other roughage accordingly and add, perhaps a half a pound of cotton seed meal to the allowance specified.

A New York Ration.

Will you please formulate me a ration from the following feeds: Have plenty of clover hay and corn ensilage, also oats and barley mixed, about equal parts of each worth about $22 per ton; ground bran, $20; shorts, $25; Diamond gluten feed $25 and oil meal, $30. Cows in full flow.
Mohawk, N. Y. F. A. H.

We are inclined to think that the following formula furnishes a fairly acceptable average ration for a herd of cows, but for copious fresh milkers we are disposed to recommend the addition of 1 lb. of oil meal.

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
30 lbs. silage	7.92	.39	4.20	.21
10 lbs. clover hay.....	8.47	.68	3.58	.17
4 lbs. oats.....	3.56	.37	1.89	.17
4 lbs. barley.....	3.56	.35	2.62	.06
Totals.....	23.51	1.79	12.29	.61

Alfalfa in Ohia.

F. W. Y., North Jackson., O. asks whether alfalfa will do well in Mahoning county, that state.

We can only answer, that alfalfa does do well in many parts of Ohio, but whether it would be adapted to the soils and conditions on the farm of our inquirer is a very different question. There will appear in this paper from week to week articles on alfalfa giving in considerable detail the character of the soil required, the best methods of fitting the soil, sowing the seed and treating the crop during the first season .A careful perusal of these articles will enable this inquirer to determine with a very large degree of accuracy whether it would be prudent for him to make the experiment of seeding a few acres to alfalfa.

Speltz.

A Maryland reader asks to be told something about speltz, how it is produced, what is its feeding value in comparison with barley.

Speltz is classed as a variety of wheat, and in some localities, where wheat, as we know will not grow, speltz is used for human food. It carries a very hard and somewhat shrunken kernel, and is ranked about with oats in feeding value. It therefore contains more protein than barley but less carbohydrates. We question whether it would be a profitable crop in Maryland.

An Illinois Ration.

Kindly formulate me a balanced ration for cows of 1000 pounds, that have freshened during the winter, the cost being taken into consideration.

For roughage I have plenty of shredded corn fodder, a little sorghum, and a limited amount of second crop clover, but owing to the season it has quite a bit of summer grass and a little timothy mixed with it. Corn is worth 40 cents per bushel; have a grinder that will grind ear corn; oats, 32 cents; bran, $16.40 per ton, and Atlas gluten meal, $20 per ton. C. E. S.
Elmwood, Ill.

We incline to the opinion that where roughage is confined so largely to shredded corn stover, which is a highly carbonaceous feed, that it is not advisable to depend very much upon corn as a supplementary grain feed. Our suggestion, therefore, would be to use the bran and the Atlas gluten feed in equal parts, and we should feed as a rule, not less than an average of 8 pounds of this mixture per day to fresh cows. If there were some cows in the herd that seemed to have an ability to use more feed we would let them have it.

An Indiana Feeding Inquiry.

Please formulate me the cheapest balanced ration of the following feed stuffs: Corn stover and good timothy hay for roughage; corn and cob meal, 45 cents per bushel; ground oats, 36 cents per bushel; bran, $20 per ton; oil meal, new process, $32 per ton. And a balanced ration of all the following feed stuffs: Corn stalks, timothy hay; corn and cob meal at 45 cents per bushel; ground oats at 36 cents per bushel; bran, $20 per ton; oil meal, new process, $32 per ton. Have plenty of hay and corn stalks, oats and corn of my own production. J. H.
Valparaiso, Ind.

Corn stover and timothy hay are carbonaceous feeds containing but a limited amount of protein, therefore, the grain feed to go with them should be made up as far as practicable from highly nitrogenous grains, like bran, oil meal, the glutens, brewers and distillers grains. This leads us to omit corn and cob meal from consideration; but if it were otherwise we should be at a loss to know whether a bushel of corn and cob meal meant a measure of the meal or the product from 70 pounds of ear corn. When it comes to a question of selecting feeds,

"ADVERTISEMENT."

I WILL CURE YOU OF RHEUMATISM

Else No Money Is Wanted.

Any honest person who suffers from Rheumatism is welcome to this offer.

I am a specialist in Rheumatism, and have treated more cases than any other physician, I think. For 16 years I made 2000 experiments with different drugs, testing all known remedies while searching the world for something better. Nine years ago I found a costly chemical in Germany which, with my previous discoveries, gives me a certain cure.

I don't mean that it can turn bony joints into flesh again; but it can cure the disease at any stage, completely and forever. I have done it fully 100,000 times.

I know this so well that I will furnish my remedy on trial. Simply write me a postal for my book on Rheumatism, and I will mail you an order on your druggist for six bottles Dr. Shoop's Rheumatic Cure. Take it for a month at my risk. If it succeeds, the cost is only $5.50. If it fails, I will pay the druggist myself—and your mere word shall decide it.

I mean that exactly. If you say the results are not what I claim, I don't expect a penny from you.

I have no samples. Any mere sample that can affect chronic Rheumatism must be drugged to the verge of danger. I use no such drugs, and it is folly to take them. You must get the disease out of the blood.

My remedy does that even in the most difficult, obstinate cases. It has cured the oldest cases that I ever met. And in all my experience—in all my 2000 tests—I never found another remedy that would cure one chronic case in ten.

Write me and I will send you the order. Try my remedy for a month, as it can't harm you any way. If it fails it is free.

Address Dr. Shoop, Box 934, Racine, Wis.

Mild cases, not chronic, are often cured by one or two bottles. At all druggists.

"My owner uses a U. S. Farm Separator and feeds me on the warm, sweet skimmilk."

"I wish my owner used one, but he does not, and I am fed cold, sour skimmilk, which accounts for my poor condition."

MORAL: If dairymen wish to raise healthy calves and also to get all the cream out of the milk,

BUY A U. S. SEPARATOR

It holds the World's Record for Clean Skimming, and the skimmilk is in the best condition for feeding

For Western trade we transfer our Separators from Chicago, Minneapolis and Omaha. Address all letters to Bellows Falls, Vt.

67 Main Street, CORTLAND, N. Y.

it is quite immaterial whether they were raised on the farm or whether they are bought in the market. They have their market value in either case, and it is cheaper to feed bran at $20 a ton than oats at 36 cents per bushel. We suggest, therefore, that this inquirer mix his bran and new process oil meal in about equal parts and feed from 4 to 8 lbs. daily, apportioning the amount according to the ability of each cow to respond.

Building a Stave Silo.

I intend to build a silo next fall. I thought I would put it four feet under the ground and put a wall of stone from the bottom of the hole to about three feet above the ground and put 22 foot 2×6 staves on top of that. Is it necessary to bevel the staves? Some say that have them it is not. How many tons will it hold 16 feet across, and how many hoops will it take? E. R.
Wisconsin.

We do not think it is necessary to bevel the staves where a silo has a diameter of 16 feet. For a stave silo 22 feet high, we would put on nine hoops, placing them two feet apart at the bottom and gradually increasing the distance towards the top. A silo of the dimensions given would hold about 113 tons.

Gasoline Engine—Molasses Grains.

Will you please give me your opinion on the following: I intend to buy a gasoline engine and want to use it to pump water as the main work, besides I want to use it for grinding, sawing wood and also for running ensilage cutter, that will cut about two tons per hour. How many horse power will it require to run the ensilage cutter of that size. Would a windmill be handier for pumping water?
Do you know anything about molasses grains for feeding cows? How much protein has it?
Phillips, Wis. C. K.

The present writer had tolerably fair success last season in filling his silo with a four horse power gasoline engine. Of course this would cut under favorable conditions more than two tons per hour, but less power would have occasioned a good many difficulties. For the second filling of the silo, that is, filling in after the first filling had settled, he used an eight horse power engine, and was much better pleased with its operation than with the smaller one. The four horse power engine is ample for sawing wood, grinding, etc.

A windmill is a very cheap source of power, and a very satisfactory power for pumping water, but it is an open question perhaps whether with an engine for other purposes the expense of running the engine to pump water would not be less than the maintenance of a windmill.

We know nothing whatever about "molasses grains as such, but we recently received from a factory at Alma, Mich., a sample of what they called "molasses dried beet pulp," which analyzes about as follows for digestible nutrients: protein, 6.56 per cent; carbohydrates and fat, 59.39 per cent, thus giving a nutritive ration of 1 to 9.

Elgin Board of Trade,

A subscriber, voicing the feeling of a good many readers in different parts of the country, inquires how it is that the Elgin Board of Trade is so much of a factor in fixing the price of butter when so little butter is offered for sale at the weekly meetings of the Board, and especially how it happens when, say, somebody offers 27 cents per pound for butter the quotation committee anounces the market to be, for example, 26 cents.

The answer to inquiries of this character, is the present method of doing business by members of the Elgin Board of Trade is an outgrowth of the conditions which obtain in many of the central markets of the country and is an attempt on the part of its conservative management to minimize the influence of speculators and speculation. It not unfrequently happens that dealers in butter, and sometimes manufacturers of butter, having a considerable stock on hand will offer to buy limited lots of butter at a price above what the general market would warrant, on the theory that this will help them to dispose of their surplus at higher figures. The quotation committee of the Elgin Board of Trade, meeting every week, makes a very careful survey of the condition of the markets in this country and abroad, and of the amount of butter on hand and likely to be produced in the immediate future, and from the information thus obtained proceed to name what they consider a fair, legitimate price for butter under all circumstances, and this goes as the Elgin price.

Improved Feeding and Improved Results.—Feeding Apple Pomace.

ED. HOARD'S DAIRYMAN:—Inclosed find $1.00 to pay for one year's subscription to your valuable paper. I have only been a subscriber for the past eighteen months, but find I could not do without it, and I tell my neighbors I had rather part with all the rest of my farm papers, of which I take quite a number, than to part with HOARD'S DAIRYMAN. I am a young farmer, have only been farming four years, but have found I could not succeed in the old way. To prove it I will give some of my own experience.

Three years ago I had twenty-five cows—I had no silo but built one that fall. I sent my milk to So. Gibson creamery, from which I received $26.54 per cow for butter fat. Fed no grain after cows went on grass in spring.

About this time I became a subscriber to the American Agriculturist and began reading an article entitled "Feeding the Dairy Herd", by Prof. Woll of the Wisconsin Experiment Station, which opened my eyes considerably. I immediately began to examine my cows, my mode of feeding, stabling, etc. The outcome was, I sold until I only had five of my original cows left. In the mean time I had bought about thirty others and sold them down to fifteen, leaving me twenty to start 1902 with. The outcome of this sorting and sifting, and care is as follows:

Returns from same creamery....		$1224.44
Creamery charges for making ⅛		174.92
Milk sold last 3 weeks of Dec. 4 cents per quart.....		145.60
Calves sold and on hand.....		150.56
Pork sold.....		233.63
Feed bo't and fed to cows and hogs.....	$550.00	
Total income from cows.....		$1939.35
Total grain bought.....	$550.00	
Balance above grain.....		$1389.35

or a net profit above grain of $69.46 per cow, said cows being nothing but natives picked out of my neighbors' flocks. Not being satisfied with present profits, I have recently bought of Henry Stevens & Son, Lacona, N. Y., a registered Holstein bull to head my herd.

I wrote you an inquiry last summer in regard to apple pomace. After receiving your reply, I wrote to Vermont Experiment Station. They sent me Bulletin No 96 on Apple Pomace, a good feed for cows, which I very much appreciated. I began feeding about the middle of September, and about October 15 began putting it in silo on top of corn. Am feeding yet; have enough to last till February 15th. Feed from 10 lbs. to 15 lbs. to a feed twice daily, which is much more than Vermont Station advises, but began slowly and have noticed no ill effects from it, although very much care must be taken in feeding it to cows heavy with calf. I find it a very excellent article to take the place of corn silage, and I can make as much milk on pomace silage and hay as with corn silage and hay, the only difference, I have to feed more hay with apple pomace than with corn silage. F. F. R.
South Gibson, Pa.

Truth to Tell

There are no other milk cans made that can equal in wearing qualities the genuine

BUHL CANS

They are tinned to stay tinned, and put together to stand years of hard service. Other cans crack easily, become dented, and being lightly tinned soon rust and go to pieces. Not so with the "Buhl Factory," "Improved Elgin" and "Genuine Iowa." They will outlast any other cans on the market, and are thoroughly and quickly cleaned. Remember, the Buhl is the only can in the world that is made with the Buhl "Victor" Can Breast and the Buhl "Victor" Round Handle. As there are many inferior imitations of this can, we stamp all ours with the Milk Can Trade Mark. Look for it. Sold by all live dealers. Ask about them, or write us direct.

BUHL STAMPING COMPANY,
212 W. Larned St., Detroit, Michigan.

The Distribution of Skim Milk.....

It is known that the just complaints of creamery patrons on account of unfair distribution of skim milk are the bane of the separator creamery business. Further disputes among patrons, annoyances to managers, hindrances to the best work of buttermakers, watering the skim milk, and many other ills in the same train are unnecessary, since the

Barber-Coleman Check Pump

has for more than five years been successfully solving the problem in many different creameries. When a patron has dropped in his check he can pump the amount of skim milk called for by his check, less the percentage taken out as cream, so in like proportion to all other checks. Its measuring apparatus is just an ordinary pump which everyone understands and knows how to operate.

What Reading Hoard's Dairyman Did for Him.

ED. HOARD'S DAIRYMAN:—For fifteen or sixteen years I have been a constant reader of HOARD'S DAIRYMAN. I consider it the best, most instructive and interesting paper published. Through its instruction I have built up a fine herd of 16 grade and registered Jersey cows, and a list of city customers, who take all the butter I make at 25 cents a pound.

While others are grumbling about hard times, and declare "farming don't pay," I have managed to live and lay by a little for a rainy day, thanks to the many, many useful hints I have found in HOARD'S DAIRYMAN. It is hard to make some farmers understand that the articles published in the DAIRYMAN are the hard experience of practical dairymen.

In bidding you good-by (Mr. Edwards has sold his farm and retired from the dairy business—ED.) I feel I am parting from an old friend. May your future be as bright as your past, and may you live long to carry forward the good work so well begun. Thanking you for all the benefits received, I am ever your well wisher. D. S. EDWARDS.

R. D. No. 6, Auburn, N. Y.

We desire to thank Mr. Edwards very much for the account he has given us of the benefit fifteen years reading of the DAIRYMAN has done him. He is just the kind of a reader and subscriber we like to have, for he grows on that which he feeds upon. We wish him most abundant health and happiness in the well earned rest he is taking.

A Tenant Farmer Reads the Dairyman.

Feeding and Fertilizing Queries.

ED. HOARD'S DAIRYMAN:—I can hardly praise your paper enough. I have been a constant reader and student of it for some time. I am a renter, keeping 25 cows, natives and mixed breeds; have at the head a thoroughbred Holstein bull.

Through reading the account of dairies I went to the trouble of weighing and testing each cow's milk, for one day in June. I found I only had 7 cows making a pound of butter or over, and from that down to a half a pound. The cow that does not make one pound of butter in one day could not stay with me long, if I owned her; the profit is too small.

I am feeding, at present, 20 pounds of clover and timothy hay, 2 pounds gluten feed, 4 pounds standard middlings; salt twice a day. Gluten costs $27; middlings, $19; corn meal, $22; bran, $22. Can't get cotton seed meal nor gluten meal. Cows are just coming fresh. Can you balance this any cheaper?

What is the practice in your section to pasture meadows in fall, or cut or plow under for fertilizer?

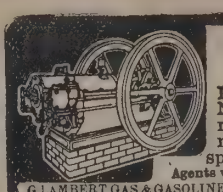
Is there as much soluble plant food in a ton of hay, spread on the land, as there is after it passes through the cow, providing it is all saved? V. H. B.

Beechertown. N. Y.

We estimate that this inquirer is feeding about 1.9 pounds digestible protein. The evidence is accumulating all the time that this is sufficient, but for his further assurance, we suggest that this correspondent try the effect of increasing the amount of gluten feed for two or three of his cows, and carefully note the results. This can only be done by weighing the milk for a week or more previous to increasing the feed, and then continuing to weigh it for ten or fifteen days afterwards.

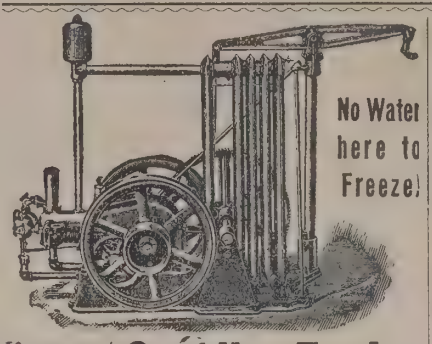
It is quite a new experience for us to read that middlings are selling at less price than bran. Usually the difference is the other way, and some caution, therefore, should be exercised to ascertain whether there is any fault with these middlings.

It is not an uncommon practice in this part of the country to pasture meadows in the fall, although there is a feeling among better posted dairymen that this is not a good practice. When it is done, the meadow should be gone over carefully with a harrow or otherwise to break up and scatter the droppings. However, if the sod is to be turned under, either in the late fall or early spring, this will be unnecessary.



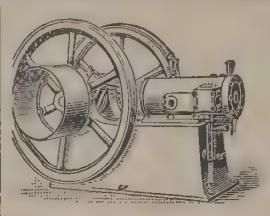
The plant food in hay or straw, spread upon the land, is not so immediately available as when it has been first passed

GASOLINE ENGINES



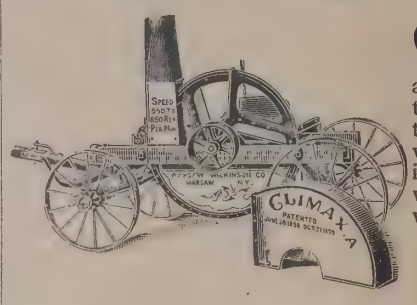
as power for the dairy have passed the experimental stage. Many dairymen now have them and all eventually must have them. The only questions to decide are the amount of power needed, and the most desirable make. With twenty-seven years of experience behind us, and a plant that has grown from 50 engines a year to 1500 a year capacity, we feel that we are equipped to build the best. There are other reasons why the "OTTO" is superior. We will tell them in this space from time to time. If in the meantime you need power, write us, mentioning this paper

THE OTTO GAS ENGINE WORKS, Philadelphia, Pa.

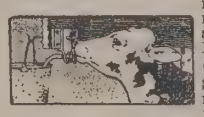


LAMBERT
Gas or Gasoline
Is the reliable engine. No long shut-down for repairs. Simple, economical. Easy to regulate speed. Strong guarantee. Agents wanted. Write for catalog.
G. LAMBERT GAS & GASOLINE ENGINE CO., Anderson, Ind.

DON'T BUY GASOLINE ENGINES UNTIL YOU HAVE INVESTIGATED "The Master Workman,"
a two-cylinder gasoline engine, superior to all one-cylinder engines. Costs less to buy and less to run. Quicker and easier started; has a wider sphere of usefulness. Has no vibration, can be mounted on any light wagon as a portable. Weighs less than one-half of one-cylinder engines. Give size of engine required. Please mention this paper. Send for catalogue. THE TEMPLE PUMP CO., ESTABLISHED 1853. Meagher and 15th St., CHICAGO.



If you want a..... Gasoline Engine
that will be always ready to start, safe, reliable convenient, economical and durable, buy a FULLER & JOHNSON Frost Proof. No bother with water nor expense of broken cylinder, no waiting for wind or weather. All sizes, stationary and portable. Send for descriptive catalogue to the manufacturers.
FULLER & JOHNSON MFG. CO., Madison, Wis.



THOMPSON-LEWIS GASOLINE ENGINES
furnish the greatest possible power at the lowest possible cost in time, labor, fuel and money. They are so simple that anybody can run them without expert training or experience. Our Volume Governor gives uniform speed. Our Acme Mixer is the most positive and economical on the market. Our Hand Starting Lever starts engine with least effort. All bearings of Phosphor Bronze. Best material and workmanship throughout. Many sizes from 4 (actual) h. p. up. Best for all farm work—cutting and grinding feed, sawing wood, pumping water, separating cream, churning, etc. Send for our free catalog before you buy. It may save you time, money and annoyance.
J. THOMPSON & SONS MFG. CO., 113 BRIDGE ST., BELOIT, WIS.

Climax Ensilage and Fodder Cutters.

GOOD RESULTS are obtained by using CLIMAX machines. You can fill your silo, cut your dry fodder and pack it away in good shape, far better and in less time, than with any other. Prices no higher than for same capacity of other makes. Few wearing parts; therefore costs little to keep in repair. Several sizes. Tell us what you want to do and we will tell you what size will suit you. Catalogue free. Write for one.

hold from 50 to 100 bushels. Spread just as thin or thick, fine or coarse, as ground requires. Don't have to stop team to make change. Most substantial, largest capacity, lightest draft.
Send today for Booklet B.
American Harrow Co
Detroit, Mich.

CHAMPION MOWER

DRAW CUT

DRAWING the finger bar of a mower from a point ahead instead of pushing it from behind gives the wheels more traction and the machine more power. This is the reason for the great cutting power of the Champion, just as it was the reason for the great cutting power of the old rear cut mowers. The Champion is front cut, but it is also draw cut, and combines the cutting power and durability of the old rear cut mowers with the safety and convenience of the modern front cuts. The Champion draws the finger bar entirely—it does not push it in the least, and in this important particular is not equalled by any other. The Champion has other valuable improvements, among them a simple and effective lining device for the finger bar, and a superb pitman having new and improved ball and socket connections both to the knife and to the fly wheel. No cramping or binding is possible with the Champion pitman, while provision is made for taking up wear and lost motion, preventing pounding and breakage. The fly wheel pin is at all times surrounded by oil, which cannot be thrown out and wasted by the revolution of the fly wheel, thus preventing heating and wear at this important and heretofore troublesome point on a mower. Write for catalog describing this wonderful modern mower, also Champion hay rakes and binders. Handsome calendar free if requested.

through the animal, but it is there and in some conditions of the soil the plowing under of the hay or straw is considered advisable.

THE CROSSING OF BREEDS.

A great many farmers are carried away with the idea of crossing breeds, especially among dairy cattle. In almost every instance we believe this practice does not prove as "improving" as it would be to hold to line breeding.

On this point Major Henry E. Alvord says:

"Any herd of mixed blood, with fair dairy qualities, can be rapidly built up and improved by the use of a well selected, pure-bred bull from any one of the four. They all seem to cross advantageously upon what is called "native stock" and upon females having a perceptible grade, or more, of Shorthorn or Durham blood. Guernsey and Jersey grades are especially satisfactory as dairy cows. But the pure animals of these strongly-bred races do not generally cross well among themselves. The Holsteins are very prepotent, and stamp their characteristics upon all their grades and crosses, yet they seldom "nick" well with pure animals of the other three breeds. The Guernseys and Jerseys mix well, but without improvement upon the parents of either side. The Ayrshire sire does not cross well with any of the others. A very superior dairy animal is, however, the usual result of crossing a good Jersey sire with an Ayrshire dam.

CONCERNING OUR ADVERTISERS.

J. Cam Anderson, M. D., of Holston Bridge, Va., says: "I am pleased to say after an experience of 20 years with Mexican Mustang Liniment, that I consider it as good if not the best liniment on the market, and sprains, bruises, cuts and sores, aches and pains—even pleurisy—all are greatly benefitted by its use. It is excellent for man or beast and every family should keep it constantly at hand and every livery stable keeper should buy it by the dozen lots at a time."

By the use of a good wood preservative, the life of a fence-post, or sill, or any other piece of timber that is especially exposed to decay, can be doubled. This is a fact which no careful, intelligent farmer can afford to overlook. It may be that the lumber is cheap, but that is not the main point, for when a fence falls down, or a building sags or collapses because the sill is rotten, the cost of repairing is a great deal more than the mere price of lumber. The wood preservative will cost perhaps three cents a post, and in the same proportion for all other woodwork, up to the silo or the barn. Nothing that a farmer can buy that costs so little will save so much, and a barrel of wood preservative kept on hand and religiously used will show a larger percentage of profit than any other article on the farm. Care should be taken to buy a good article, made by a concern whose knowledge and reputation guarantee the quality of their product. See ad. of Samuel Cabot, Boston, Mass.

DAIRY MARKETS.

ELGIN, Feb. 23—Butter—No offerings of butter and no sales on the board of trade to-day. The Quotation Committee declared a firm market at 27c, 1c higher than last week. Output of the week was 509,000 lbs.

On account of the Mardi Gras at New Orleans and Mobile, excursion tickets will be sold February 17 to 22, inclusive (and for trains arriving at Mobile or New Orleans by noon of February 24), at one fare for the round trip with favorable return limits. Excursion tickets are also on sale daily, at reduced rates, to the principal winter resorts in the United States and Mexico. For full information apply to ticket agents Chicago & North-Western R'y. 52-3

Guernsey Cattle—Clover Knoll herd. Send for circular. M. SAGER, Orangeville, Pa. 50-12

Guernsey Grade Heifer—For Sale 10 Guernsey grade young heifers. Seven of the lot 1 year old; 3 six months old, all in fine condition. Just right to serve as the foundation of a fine dairy. A finely bred young bull, 10 months old, registered Guernsey, to head the bunch. These heifers were bred from some of my finest grade Guernsey and Jersey cows. The lot will be sold at reasonable price. W. D. HOARD, Fort Atkinson, Wis. 52 tf

I want to develop the best and most modern sanitary milk producing plant to supply best city trade. A snappy young dairyman with good health and habits and some money and education is invited to co-operate. A gentleman of wealth who loves farm and dairy can also find pleasure and profit in assisting. Please investigate. BOX 1423, New York City. 52-4

For Sale—Creamery in good condition. Well located. Good trade. W. D. COE, Washington C. H., Ohio. 3-2

Investigation of the Patrons of the Onodaga Co., N. Y. Milk Association.

Conclusion of Report, and Tabular Statements.

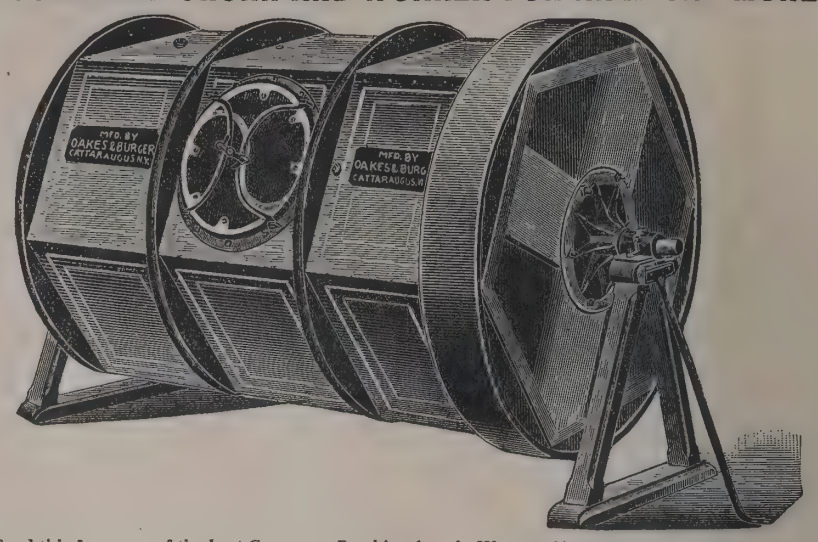
ED. HOARD'S DAIRYMAN:—Following is conclusion of my report:

Patron No. 41—Number of cows, 25; grade Holsteins. Cost of keeping, per cow, $49; average ration, alfalfa, corn ensilage and stover, and pasture; wet brewers grains, one-half to one bushel per day for 12 months; good stable; returns from creamery, per cow, $55.80; pounds of milk, 5,168; price of milk per 100 lbs., $1.08; reads agricultural papers.

Patron No. 42—Number of cows, 9; grade Holsteins. Cost of keeping, per cow, $45; average ration, alfalfa, corn stover and pasture; one-half bushel of wet brewers grains for twelve months, and two pounds of bran, corn and gluten meal for winter months; warm, and fairly light stable, saves the most of the liquid manure; returns from creamery, per cow, $56.57; pounds of milk, 5,307; price of milk per 100 pounds, $1.04; buys part of cows to keep up the herd; some abortion; reads agricultural papers.

Patron No. 43—Number of cows, 50; thoroughbred and grade Holsteins. Cost of keeping, per cow, $48; average ration, alfalfa and clover hay mostly; ten pounds grain, in winter, and two or three pounds in summer, feed dried brewers grains, malt sprouts, some bran and corn meal; warm stable; floor leaks some of the liquids; returns from creamery, per cow, $31.92; pounds of milk, 3,123; price of milk, per 100 pounds, $1.02; raises part of his cows; some abortion; reads agricultural papers.

Patron No. 44—Number of cows, 20; grade Holsteins. Cost of keeping, per cow, $50; average ration, alfalfa, mixed hay, corn stover and pasture; one-half to one bushel of wet brewers grains for twelve months, with a little gluten, and barley meal in winter; warm stable, fairly light; saves liquids; returns from creamery, per cow, $42.45; pounds of milk, 4,007; price of milk, per 100 pounds, $1.06; buys part of cows; reads agricultural papers.



Patron No. 45—Number of cows, 13; grade Holsteins. Cost of keeping, per cow, $52; average ration, alfalfa, corn stover and pasture; one-half to one bushel of wet brewers grains for twelve months; warm stable and light; saves liquid manure; returns from creamery, per cow, $92.31; pounds of milk, 8,392; price of milk, per 100, $1.10; buys part of

THE CHAUTAUQUA

A COMBINED CHURN AND WORKER FOR HALF THE MONEY

Read this from one of the best Creamery Combinations in Western New York.

OAKES & BURGER, Cattaraugus, N. Y. WILLINK, N. Y., December 28th, 1902

GENTLEMEN:—We purchased two Chautauqua churns of you in the spring of 1902 and wish to recommend the Chautauqua churn as the best combined churn and butter worker on the market without exception. We have a Victor which is a good combined machine, but prefer the Chautauqua as it is made by your firm, to any other worker. We work our butter in less than 15 minutes and it is neither salvy or streaked. (Signed) Yours truly, **COLE & FISH.**

Write for our new thirtieth annual catalogue of up-to-date Dairy Apparatus.

OAKES & BURGER, Cattaraugus, N. Y.

Flavor

The market value of butter is unquestionably its flavor, and its flavor is unquestionably affected by the quality of the salt used. Prize winning butter makers always use DIAMOND CRYSTAL SALT—"*the Salt that's ALL Salt*"—to insure that *winning flavor*. Its pure, dry flakes quickly dissolve—assimilate *evenly* through the butter, and add a keeping quality that is inestimable. No waste—no grit—no mottled effect. The only salt in the world that's all salt. Dairymen will find our illustrated booklet "Just Salt" contains valuable hints. We send it free.

DIAMOND CRYSTAL SALT CO., ST. CLAIR, MICH.

WORCESTER SALT
IS THE BEST

The largest Creamery in the world uses WORCESTER SALT, and—this telegram tells the rest:

SILOS

FROM PUGET SOUND TO YOUR FARM. We shall ship to your town, Silo Stock of **Staves One Piece the Depth of Silo. Oregon Pine** which owing to length must be handled in car loads, giving to people contemplating the erection of a Silo in 1903 the benefit of through car load freight rates in a delivered price on Silo complete. Write us, giving size best adapted to your wants, and have booklet, "Silos and Silage," mailed you. It shows how to build, how to fill. **WILLIAMS MFG. CO., Kalamazoo, Mich.**

cows; no abortion; reads agricultural papers;

The amount received by each patron for $1.00 invested in feed is as follows:

No.	
41	$1.14
42	1.26
43	.67
44	.85
45	1.78

The average return of each $1.00 invested in feed of those who did not read agricultural or dairy papers was $1.20 and of those who did read was $1.35, making an average gain of $.15 for those who read over those who did not read.

The average cost of keeping a cow was $42.66, therefore he would gain $6.40 per cow, and on a dairy of 20 cows, he would receive $128 00 more than the man who did not read. W. H. JENKINS.

New York.

The Empire Meet.

ED. HOARD'S DAIRYMAN:—A creamerymen's convention decidedly unique in character was held in McGregor, Iowa, on January 28, 29, 30 and 31, under the auspices of the Empire Cream Separator Company of Bloomfield, New Jersey. Mr. E. E. Bell, the secretary and sales manager of the company originated the idea and presided at its several sessions. The object was to get together some of the leading creamery men of Iowa and Wisconsin for a general discussion of the hand separator proposition and its bearings upon the dairy interests of the day. There were about sixty-five persons present through the four days' session, and the new cream question in all its various phases was very thoroughly discussed.

Among the topics were the following:

"Economics of the Hand Separator System and its influence upon the Dairy Industry."

"The advantage to the Creameryman of the Hand Separator System in Creamery Operation."

"The advantages to the Farmer or Milk Producer in the Hand Separator System of Creamery Operation as compared with the Whole Milk System."

"The best methods for collecting cream to the central churning point in good condition."

"Methods of caring for Hand Separator Cream and why it is easier to control the quality of product through having the Farmers deliver cream than Whole Milk."

"Making extras from Hand Sepatator Cream. Why and how it can be done more easily than through operation upon the Whole Milk and Skiming Station Method."

"To what extent is it profitable for a creamerymen to interest himself in the education of the farmer in methods of operation which benfit both, and how can this education be most successfully accomplished?"

"The advantages to the Creamery man in being his own Separator agent."

"Essential qualities of a good Hand Separator."

"Is it advisable to place machines on trial with the Farmer? If so, under what circumstances and upon what conditions?"

Other topics having a more special bearing on the Empire Machine were presented at some length. Mr. Ernest E. Bell, secretary of the Empire Company, presided and kept a directing hand on the general discussion.

On of the most interesting features of the entire meeting was Mr. Bell's explanation of the scientific principles of centrifugal separation and an explanation of the Empire Separator.

Of special interest were the addresses of Charles Harding of the Hygeia Creamery Company of Omaha, and W. W. Marple of the Blue Valley Creamery Company of St. Joseph, Mo. Both of these gentlemen, as is well known, are conducting large creameries on the Hand Separator plan, and buying cream from farmers two and three hundred miles distant. Other creamery men who are operating on a smaller scale were present and added their testimony to the effect that the Hand Separator has undoubtedly come to stay, that it means a greater economy of production for the creamerymen and greater profits for the milk producer.

It was agreed that the creamery man is neglecting his best opportunities if he does not secure the agency for a good cream separator and thoroughly educate his patrons in its use. The advantages to the farmer were clearly pointed out. In the first place, the Hand Separator reduces the labor of dairying nearly one-half and is likewise a great saver of time. Moreover, it gives him fresh, warm skimmed milk for feeding purposes, thus adding very materially to his profits. From the creamery side, it was maintained by those who had tried them, that they could undoubtedly pay patrons a higher price for butter fat the year round under the Hand Separator system than they can under the whole milk system, and if the patrons use a good separator and give it proper care, the creamery men can produce a better quality of butter than he can under the whole milk system. It was admitted that when the hand separator was first introduced, such was not the case, simply because the early hand separator was of so complicated a pattern and so intricate in its mechanism that it was impossible for the patron to keep it perfectly clean, but the modern, simple separator, of few parts, is easily washed, and there is really no excuse for it not producing cream of the very highest quality, at least the gentlemen present maintained that the Empire always does it without fail.

We have not space to go into the details of the discussions, but we hope that the Empire Cream Separator Company will issue some of the excellent addresses made, in printed form, so that dairymen and creamery men in general may read them. Mr. E. E. Bell is to be congratulated upon the happy idea of this meeting.

The town of McGregor was most hospitable to the visitors, giving the convention a public reception with an address of welcome by the Mayor upon the first night, a dramatic performance on the second night and a dance on the third evening.

We understand that the Empire people will hold similar meetings in other parts of the country. They are doing a good work in agitating better dairy and creamery methods; it means more money for all personally concerned. M.

Plan for Farrowing Pen Wanted.

ED. HOARD'S DAIRYMAN:—I would like to ask Mr. Wing through the columns of your paper as to the best plans for a moveable, individual, farrowing pen or house for a brood sow.

I have been a reader of your paper for several years, and do not know how to do without it on the farm. A. B. C.

Fort Hill, Ill.

We Start BOYS in Business

We have started over three thousand boys in various parts of the country in a profitable business on their own account. We want a boy to represent

The Saturday Evening Post

In every town. The work can be done after school hours and on Saturdays. It is pleasant, as well as profitable. The magazines are sold among neighbors and friends in offices, stores, as well as in homes.

No Money Required to Begin

The first week's supply is sent free. These are sold at five cents a copy and provide the money to order the following week at wholesale prices.

$225.00 IN EXTRA CASH PRIZES will be distributed among boys who sell five or more copies.

Our FREE booklet gives portraits of some of our most successful boy agents and their methods.

The Manure Question.

ED. HOARD'S DAIRYMAN:—This manure discussion has been very interesting to me. So far no one has just hit my own plan so I will give it in as few words as I can—perhaps it may be of service to some one.

I am pleased to say that through this section "corn is king." Nearly every farmer has his silo and the manure from the farm goes to fertilize next year's corn crop. It is either drawn out daily or in the spring.

Our farmers are coming more and more to use absorbents to save liquids. Now I believe we are entirely wrong in using our manure to produce a crop ofcorn I had a friend who was troubled with heart disease. He employed a doctor in the city of Olean, but to no purpose. He came home and a country doctor began treating his stomach. In a few months he was entirely well. Now this is, I believe the course we should follow with our corn. "Doctor our meadows,to cure our corn."

Every one knows that (in Bradford Co.) a heavy sod plowed under will, with good cultivation, produce a good crop of corn. How often I have heard farmers say, "This field is all run out. It won't raise hay this year, we must plow it up for corn." All wrong. "This field is all run out, we must manure it, sow grass seed next spring and when we have a good sod, plow it under for corn." One horse will furnish enough absorbent for five cows, with a little saw dust.

This mixed manure makes a grand top dressing for a meadow, be it drawn out daily or piled under a shed till a slight fall of snow makes it an easy thing to top dress the field farthest from the barn, which too often is the poorest on the farm.

When our country was new the falling leaves made a heavy mulch under the trees, and the rootlets were always supplied with the proper amount of water. When the trees were cut off and the ground cleaned up by burning, a handful of this soil was seen to contain countless numbers of little roots, small pieces of leaves, bark, rotten wood, moss, etc., and seemed nearly as light and mellow as a handful of down.

It has been plowed and plowed and then plowed again,each time a crop taken off, and no vegetable matter returned until now some of our soil looks more like a ball of mud. What is the remedy? Green manuring of course. Plow under twice as much as you take off and in a few years your cover crops will be so big that they simply won't turn under. Look at our tobacco growers. Thirty loads of manure to the acre. No ground permitted to lay over the winter without a heavy crop of rye growing on it. The result? Tobacco worth from $100 to $200 per acre. Are there any such possibilities in a crop of corn? Last summer I weighed a number of corn stalks. They averaged about 4 pounds each. If there are four stalks to the hill that makes sixteen pounds per hill. Planted three feet apart each way, there are about 4,500 hills per acre. This makes 36 tons per acre.

I believe that this corn is worth, everything considered, much more than any acre of tobacco, to the farmer. Is this calculation absurd? I don't think so. If we gave our corn the attention that tobacco gets I believe it would surpass 36 tons per acre.

Well! well! I have taken up too much space already and havn't said much about manure either, but whether you haul it out daily or weekly, or monthly or yearly, use it to make meadow is to be my rule for a few years to come. At least till I see the folly of it or else the benefit. L. C. BURROUGHS.

Pa.

Farm Wagon Only $21.95.

In order to introduce their Low Metal Wheels with Wide Tires, the Empire Manufacturing Company, Quincy, Ill., have placed upon the market a Farmer's Handy Wagon, that is only 25 inches high, fitted with 24 and 30-inch wheels with 4-inch tire, and sold for only $21.95.

This wagon is made of the best material throughout, and really costs but a trifle more than a set of new wheels and fully guaranteed for one year. Catalogue giving a full description will be mailed upon application by the Empire Manufacturing Co., Quincy, Ill,, who also will furnish metal wheels at low prices, made any size and width of tire to fit any axle.

All Humors

Are impure matters which the skin, liver, kidneys and other organs can not take care of without help, there is such an accumulation of them.

They litter the whole system.

Pimples, boils, eczema and other eruptions, loss of appetite, that tired feeling, bilious turns, fits of indigestion, dull headaches and many other troubles are due to them.

Hood's Sarsaparilla and Pills

Remove all humors, overcome all their effects, strengthen, tone and invigorate the whole system.

Exile of St. Lambert

—13657—

is the sire of more tested Jersey cows than any bull living or dead, and the number to his credit will probably never be equaled by any other bull. His dam was one of the largest milkers among Jerseys, and is the dam of the three year old cow with the highest year's milk record for that age. Exile's sire is the grand sire of the cow holding the highest milk record for a year.

The mid-winter sale lists include a few tested daughters of this great bull and several cows and heifers deep in the blood that produced this famous sire. If you wish to improve your herd, or to start one, you will probably never have a better opportunity than is here offered. If interested write for lists, and please specify whether bulls, cows in milk, or heifers, are wanted.

WINTERGREEN HILL FARM, Scottsville, N. Y

Biltmore Jerseys.

J. S. CAMPBELL, Prop., Butler, Pa

Silos in Tennessee—Alfalfa.

ED. HOARD'S DAIRYMAN:—I am only a recent subscriber to your paper, but what few copies I have seen have pleased me very much. I am interested in the dairy business, own 40 cows and furnish hotels in Memphis with cream. From what information I have gathered from agricultural papers in regard to the silo, am satisfied that it would be profitable in my business. Two of my neighbors built silos, but practically they were failures. Does the climate of our southern states affect the practical use of the silo? Does the advertised silo already built have any advantage over a home made one? Fifteen years ago, this was a clover producing country, now there are no clover fields in this county. We have great difficulties in securing a stand and everybody raises cow pea hay. I would like to try alfalfa; do you think it could be grown in this climate? Will it stand a summer drouth of six weeks?

Whitehouse, Tenn. J. N. B.

Climate has no influence on the keeping quality of silage. Spoilt silage comes from imperfections in the silo itself or the quality of the material used for filling it.

Thus, too dry corn almost always results in spoilt, moldy ensilage, a condition which may be prevented by the addition of water after the silo has been filled. Unless the silage has been well packed when filling, spoilt silage will also result, and lastly a silo that is not built tight always allows a large amount of the contents to spoil. But with a properly built silo and corn of the right quality at time of filling, there is no reason why good silage cannot be made in Teneessee as well as elsewhere.

If the home made silo is properly built, it is just as good as the advertised article.

We have no doubt that alfalfa will grow in Tennessee as it has been reported as growing successfully in many of the southern states. It withstands drouth better than any other forage plant.

AVERILL & GREGORY, The Yates, Syracuse, N. Y.

Pennsylvania Pickings.

"What is the Matter with Him?

ED. HOARD'S DAIRYMAN:—On page 1050 of HOARD'S DAIRYMAN the above question is asked, and we, "good readers" of the DAIRYMAN, are requested to answer it. The subject of the question appears to be a Pennsylvania man, and it is meet that this state should be early with an answer. There are many good and progressive dairymen in Pennsylvania, as well as many more of the kind about which the DAIRYMAN asks its question.

This is the second state in the Union as a dairy state, and of necessity we have dairymen in all the degrees. That we have many who are honestly and industriously improving their conditions, the weekly issues of the DAIRYMAN can be made to testify, for, without keeping count of them, I think there are more questions asked from Pennsylvania than from any other state.

This would indicate that our dairymen take a good dairy paper and that many of them are after all the good to which their subscription entitles them. But our trouble is not with those farmers and dairymen who read the dairy and farm papers, but rather with those to whom the journals of their business are either strangers, or the teachings and suggestions in them nothing but vanity.

It is pretty hard to teach a man who will not even look at the lesson and who takes Solomon's declaration about there being nothing new under the sun, as having literal and special reference to agricultural lines.

Manifestly, our greatest need in all farming and animal husbandry is that of more education. We are not getting it. The forces that should be most active in instruction are either doing nothing or making no show.

We have a State Dairy Union that is supposed to be the exponent and helper of all that is good and new in dairying. It is five years old, yet instead of growing with the needs of the business in the state, and in numerical and representative membership being commensurate with the importance of so great an industry, the growth is really that of the cow's tail. It has the dry rot. It has dropped into or gravitated towards politics and its little usefulness is about at an end. It now has sixty members, not over fifteen of whom are dairymen. At the last annual meeting of the Union, the president of it declared that in all the large force of so-called farmers' institute instructors, there were not over half a dozen qualified to teach the dairymen the best methods of his business.

The director of institutes made a feeble effort at a general denial of the charge, but outside of his denial the charge has stood unchallenged, publicly.

That poor teaching is worse than no teaching is demonstrated by the need of the DAIRYMAN asking its question, for while we have three or perhaps four good, advanced, dairy instructors on the force, Martin only knows how many bad ones there are, and their teaching is so dismally poor that the suspicions formed at once detect its poverty and its sham; so that when he has now and then a chance to hear the advanced teaching of a Lighty, a Detrich or a McDonald, not understanding it, by the same token he thinks it sham, also. And he goes untaught, and once a year a department bulletin comes out and tells us how many thousands attended the institute, but no foot note tells that the noses counted at the evening sessions, when school essays, recitations, or jokes swelled the crowds, are most responsible for the big numbers.

This is what is the matter with him. He needs more careful education, and he is not getting it. Occasionally he or his son gets to reading the DAIRYMAN, or some other good paper, and the new light is let in, but first "desire must ope the portal." This reading is absolutely all, with very few exceptions, he is getting in the state, second in the dairy list.

The farmers' institute, in many ways, has done much for Pennsylvania, but under the management of it for a few years past it has reverted to type, has not even kept up to the times, when it should have a position in advance.

If the DAIRYMAN in its question, and I in my answer, have respectively assumed and told what is not true, let Pennsylvania say so. W. F. MCSPARRAN.

Neufchatel Cheese.

ED. HOARD'S DAIRYMAN: Can you give me the receipt, or let me know where I can get it, for making Neufchatel cheese? W. C. B.

Leadville, Colo.

We are somewhat uncertain whether this inquirer actually wishes to know how to manufacture the true Neufchatel, or the soft sour milk cheese which is frequently found in the markets and sold under the name of Neufchatel cheese, which it is not. However, following is the method for making the true Neufchatel cheese:

The fresh morning's milk (about 90°) is set in a stone jar, holding about forty pounds or less, and only rennet enough to coagulate it in about twenty-four hours is added when standing in a room of about 60°, and, "hence, it is necessary to use a reliable rennet extract." The jar may be covered with a woolen blanket or the like, to keep the temperature uniform.

When coagulated, the whole mass is poured into a cheese cloth, which is either placed in a basket, or hung up on four supports fixed for that purpose. Here it is left twelve hours to drain. Then the cloth is gathered together round the curd, and placed in a square wooden box, with perforated bottom and sides, and a pressboard put on with weights, say a few stones, and if more weight is needed a small lever press. It is pressed for twelve hours, and then kneaded by hand *on dry cloth* into a uniform stiff paste; and it requires experience to know the right consistency.

If it is too moist, new dry cloths are placed under it, and it is worked until dry enough. But if too dry, it is a sign that either too much rennet has been used, or the curd has been pressed too much. In this case some new curd is added and carefully mixed with the other.

When of the right consistency, it is put into the molds, little tin cylinders of 2½ inches diameter and 3 inches high; as far as that goes, any little empty tin can may be used by unsoldering the top and bottom. After smoothing both ends, it is taken out again, and salted on the outside by strewing the salt on both ends, and lightly rolling them between the hands covered with salt.

They are then placed on a draining board, of any kind that is handiest, and left for twenty-four hours. In the drying room are lath shelves, on which smooth, dry straw is placed, and the cheese are laid there without touching each other. They are turned often enough not to lose shape or stick to the straw, and in two or three weeks they are covered with their "first skin," which is, when the white mold showing after five or six days, turns

"ADVERTISEMENT."

AT THE NATIONAL CAPITAL.

What Postum Did There.

A well known figure at the National Capital is that of an attorney-at-law and solicitor of patents, who has been practicing before the courts and the Department of the Interior at Washington for more than 25 years. The experience of this gentleman with coffee is unusually interesting for it proves that although the ill results from coffee are slow they are sure. He says: "I have consumed coffee at my meals for many years, but of late years have been annoyed by deranged stomach and sleeplessness, pains in my head, nervousness and confusion of the mind. About 18 months ago I quit coffee and commenced to use Postum Food Coffee and have experienced the most pleasing and benefical results therefrom.

"It has aided my digestion, increased my appetite for healthy food, appeased my stomach, invigorated my brain, cleared and quieted nerves and mind, and enabled me to sleep soundly 8 hours out of the 24. It has imparted buoyancy and cheerfulness to my daily life and caused me to look on the bright side of things in general. It has fitted me to do more brain work than ever before, and I would consider it a calamity to be deprived of its use.

"I look on Postum as an absolute cure for the ills that coffee causes. It not only cures the ravages of coffee but stimulates to vigor and healthy action the brain and all the organs of the human body. It has with me and with many of my friends and this is my authority for the statement." Name furnished by Postum Co., Battle Creek, Mich.

The New 1903 REID HAND SEPARATOR

The 1903 Reid Hand Separator is the most exact milk skimmer ever made—it is simplest, fastest, lightest running, and affords most butter-producing material under all conditions. It creates a new source of revenue and maintains the income—

WEARS LESS, LASTS LONGEST

Every Reid Hand Separator is sent out under a positive guarantee, and is sold on its own merits. If you want a separator we will send a Reid on approval—work it ten days and if it does not excel all others return at our expense. Send for new catalogue and revised price list, mailed free.

A. H. REID, 30th and Market Sts., Philadelphia, Pa.

From Cow To Cream

is but a short journey on the farm that runs the

AMERICAN Cream Separator,

the one that gets the profits, and runs without an expert. We let you test it yourself and return if it is not a money maker for you. The price makes it easy to buy. Write now for free catalogue.

Creasey Ice Breakers

Dairymen and shippers of milk and cream find them most efficient, economical machines, and the greatest savers of time and ice. Easy to operate. Rapid cutters. The design is right.

Made in sixteen sizes to suit every requirement. Send for catalogue "11-B" which gives full particulars.

J. S. L. WHARTON, Mfr.,

17th & Clearfield Sts. Philadelphia, Pa.

into a blue mold. They are now taken to a cellar with similar shelves, where they are placed on end on the straw, and turned every three or four days. After three or four weeks in this place, red spots begin to appear, and the cheese is ready for the market. It takes 6 pounds of milk to one pound of cheese.

This cheese, like all kindred cheese, is hard to produce uniform, unless special rooms are provided, and I describe the manufacture just to give an idea about the principle. Experimenting in the making does not cost much, as two or three gallons of milk is all that is required, and the outfit need hardly cost anything.

Instead of straw, the wooden mats or "splashers" made of the same kind of wood as matches, may be used for drying the cheese on.—*From Monrad's A B C of Cheese Making.*

Foot and Mouth Disease.

ED. HOARD'S DAIRYMAN:—I have had that terrible foot and mouth disease in my splendid herd of 38 cattle that I was fourteen years breeding and getting to where I was. I retailed my milk at 7 cents per quart, and was milking 240 quarts a day from 24 cows, when my cattle were taken down with the foot and mouth disease.

The first day of December, 1902, my cattle were taken sick and I milked them what I could, doctored them all I knew how; washed their feet with sulpho-napthol, which killed the germ in the foot. Their mouths were so covered with ulcers that it was impossible for them to eat, and they would stand and slobber for about four or five days.

Their teats had water-like blisters on them, and by milking them, the blisters would break, and then would come a scab, and that scab made it impossible to milk them. Their udders became gargety and terribly sore. I had five of my best cows, that were so very bad they had to be killed in the stable; they were so weak that for seven days they hadn't stood on their feet.

The disease works just like this, the finer the cow is bred, and more milk she gives the worse they are affected. My two-year-old heifers seem to get over it in a week, but they are all better off to be killed than left to get well if they could.

That disease in a barn full of milch cows is terrible; the cows suffer something awful. My barn has been disinfected, and the stable repaired, new mangers and floors; and burned five tons of hay, that is, the hay that was exposed. The government pays 70 per cent of their well value; repairs of barn at cost, and market value for hay. The good old state of Massachusetts is going to pay us poor unfortunate ones the other 30 per cent on the value of our cows, and 25 cents a day for each animal quarantined after the first ten days.

My cows were all killed and buried in a trench back of the barn, 84 feet long, 7 feet wide, 7 feet deep, the 19th day of December, 1902, and still I shall keep on. When the quarantine is removed I shall purchase pure stock and commence all over again. ISAAC ALGER, JR.

Massachusetts.

Education and Ignorance.

ED. HOARD'S DAIRYMAN:—In the DAIRYMAN of Jan. 23, page 1050, you ask the good readers what ails these cow farmers who don't want to learn. Just this—ignorance, indifference and lack of gray matter.

Among all classes, are people who unhappily for themselves disregard knowledge, who having little or no information are content to live and labor under every disadvantage. They never equal nor rise above their fellow men, for as neither pleasure nor profit can be derived from them, they are compelled to labor with strong application of physical force, but none of mind.

The least intelligent among the lowest scale of farmers is sure to think that he is the best of all farmers and that his multitudinous mistakes and mishaps are owing not to his lack of skill or knowledge, but to the circumstances in which he is placed. He holds books and book farming in utter contempt. Professors and gentlemen farmers, who milk and feed with pen and ink in a sumptuously furnished office, can neither teach him nor cater to his needs, which, God knows, are many.

He has no idea of business methods and no inclination to learn. His experience of 20, 30, or 40, years is conclusive evidence that he knows that money making along dairy lines is a delusion and a snare. He never weighed a quart of milk or feed in his life and never will, but his knowledge on dairy topics is freely dispensed from the top of a dry goods box in the village store, while his cows, if they have life enough in them, are bawling for a bundle of dry corn stalks or a little straw.

He does not know that the successful man of today, be he farmer or merchant, is ever on the alert to increase his business, cheapen the cost of production and is constantly studying for more information in his special line. He has not sense enough to know that the nodding harvests in the fields, or the success in the dairy of his progressive brother farmer would crown his own efforts if he had the same knowledge, the same power and skill.

We see a man occasionally who, seeing the folly of his ways, calls to his aid the wisdom, experience and skill contained in the DAIRYMAN and agricultural and dairy literature of the day, buckles down to his work and resolutely overcomes the difficulties that beset him.

Verily, there is a mighty chasm between the ignorant and the practical, progressive farmer.

We respectfully request that "Double U Dee" not to bother his head with the man who don't want to learn, but rather put in his time and best efforts to a better purpose—that of catering to those of us who hunger and thirst for more and better knowledge along dairy lines, and continue to furnish us with the gray matter, which is characteristic of his paper, at a dollar a year, though we are willing to pay much more. J. HOWARD.

New York.

Feeding City Swill to Pigs.

ED. HOARD'S DAIRYMAN:—As T. B. N. of Frankfort, N. Y. has had trouble with his pigs from feeding "city swill" to them, and as I have seen the same effects that he has, I think that I can help him out of his difficulty.

Undoubtedly the swill has too much lye or strong potash in it which has been added to cut the grease in washing dishes. If T. B. N. will cut open one of his dead pigs he will find that the stomach and intestines are literally eaten to pieces. He should be careful to avoid feeding dishwater, using only table scraps. He can do this by furnishing an extra receptacle so they may not be mixed. Then by giving an acid test to determine the alkali (lye or soda) in the swill, I think will avoid the trouble.

As to the pigs now affected, if they will eat, be careful to give them nothing that will irritate them, so as to heal the sores. If they cannot eat drench them with something soothing. O. A. L.

MEXICAN MUSTANG LINIMENT

The good old—60 years old—time-tried liniment has ever been the friend of domestic animals. If they could speak they would with one voice proclaim it

The Great Barnyard Remedy.

No other remedy has been so speedy and so sure to heal their cuts and sores, remove swellings, inflammations, stiff joints and lameness and cure from their scores of incidental hurts and injuries. In the dairy there is no other remedy its equal for curing sore teats and caked udder. From its original compounding sixty years ago to the present it has been the great approved remedy for the horse and is equally valuable for injuries to mankind. It is

The Liniment that Penetrates,

that soaks right in to the very bone and routs all pains, inflammations and soreness, no matter how chronic or deep seated. **In three sizes, 25c, 50c and $1.00.** Largest is cheapest. Sold everywhere by liniment dealers. Write us for free booklet, "Points from a Horse Doctor's Diary."

COMMON SENSE Calf Feeder

awarded **Gold Medal** at Pan-American Exposition. **The only Feeder** adopted by experiment stations. It is the kind others try to imitate. Easiest to operate and clean.

Most Durable, Simple, Economical, Scientific and Practical.

Do not be deceived by imitators. Shams are never imitated. **More Common Sense Feeders are in use than all others combined.** Over 50,000 in use. No valves to get clogged or foul. Nipples reinforced and cannot collapse. The calf feeder is a perfect weaner. A substitute for nature.

Extra gain on one calf pays for two feeders.

Best Feeder Made.
Michigan State Board of Health:—I tried every Calf Feeder I could find, but liked yours best.

Worth $10.00.
George S. Bement, Victor, N. Y.:—I am very much pleased with the Feeder and would not be without it for $10. No trouble, no damning, no milk on your clothes, no trouble to teach the calves to take hold of it, no sucking the cows, and the best of all is that when they get about eight weeks old they don't stop for the nipple but just drink out of the pail.

The Principle is Correct.
Purdue University Agricultural Experiment Station of Indiana, LaFayette, Ind.:—We have been using the Feeder to some extent and it is in constant use at this time and we believe it to be very satisfactory in its work. The principle of **Your Feeder,** I believe to be the correct one. C. PLUMB, Director.

Advise Stock Raisers to use it.
Maryland Veterinary Hospital:—I am very much pleased with the Feeder and would advise stock raisers not to be without one.

Price $1.50 including two nipples, sent postpaid for $1.75. We guarantee satisfaction, but if you are in doubt about its value we will send one on approval for 50c to cover postage, remainder to be paid if satisfactory. **Be Sure** and send for our twenty-two reasons why you should use a feeder. It's free. Sold by one dealer in a town.

Queries in this department answered by DR. A. H. HARTWIG, Watertown, Wis.

Infectious Abortion.

The dairymen in this section are having trouble in our dairies by abortion. Can you give us some light on the subject, as treatment of cows in dairies with several abortions. J. M. D.
Wiscoy, N. Y.

I have a thoroughbred Jersey heifer that by accident got with the bull and got in calf, twenty days before she was one year old. In just six months to a day she aborted. I am almost sure that this abortion was caused by injury. I let her go six months and bred again, and she carried this calf 253 days when she aborted again. How near calving time would you advise to use the carbolic acid or the powdered cramp bark treatment for abortion? Is there anything that I can give a cow that has aborted that will cause the afterbirth to come away? J. R. W.
Birmingham, Iowa.

ANSWER

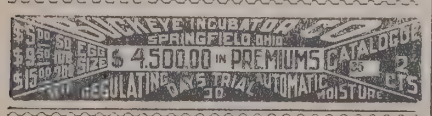
This question has been answered almost every week in some torm for the past year or two.

The heifer may have had an accidental abortion, but it is always better to suspect her of being infected and liable to introduce infectious abortion into the herd. We have outlined a practical treatment for this disease on page 1039, which has proven a success in every case where it has been carried out, and would advise you to apply the same to your heifer and all animals which have aborted. The treatment consists of an application of antiseptics directly to the seat of the trouble, thus preventing the multiplication of the germs by destroying them in the very first case. We do not advise the use of carbolic acid unless you

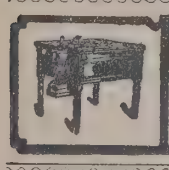
Paint Without Oil.

Remarkable Discovery That Cuts Down the Cost of Paint Seventy-Five Per Cent.

A Free Trial Package is Mailed to Everyone Who Writes.



A. L. Rice, a prominent manufacturer of Adams, N. Y., has discovered a process of making a new kind of paint without the use of oil. He calls it Powdrpaint. It comes to the farmer a dry powder and all that is required is cold water to make a paint weather proof, fire proof and as durable as oil paint. It adheres to any surface, wood, stone or brick, spreads and looks like oil paint and costs about one-fourth as much.



Write to Mr. A. L. Rice, manufacturer, 346 North St., Adams, N. Y., giving the name of the dealer from whom you buy your paints. Mr. Rice will send you a free trial package, also color card and full information showing you how you can save a good many dollars. Write to-day.

$5 FOR NOTHING. We have paid that sum several times for less information than is contained in our grand new book, "*How to Make Money with Poultry and Incubators.*" 8x11 inches, 196 pages. "Planet Jr."
Horse Hoe and Cultivator

is without doubt the best, best known and most largely used one horse cultivator in the world. There is not a civilized country on the globe in which it is not known and used. This could not be so if it did not possess true merit and worth. It has a large number of attachments which make it readily adaptable to all uses and nearly all crops. Note the two levers. The one standing upright is for regulating the width. It changes the width of the tool for wide or narrow rows. The other lever operates the wheel and depth regulator simultaneously to a nicety. It is made of the very best material throughout and with reasonable care will last indefinitely. It is a great favorite with potato growers, truck farmers and general farmers. It is but one of our fifty seeding and cultivating implements, including plain and combined Seed Sowers, Wheel Hoes, Hand Cultivators, Walking Cultivators and One and Two-horse Riding cultivators, Special Sugar Beet Tools, etc. Our new 1903 catalogue is fine. It contains over 100 illustrations with full descriptions and prices. It costs you nothing and will make you money. Write for it at once.

wish to inject it in a greatly diluted form into the vagina or uterus after abortion. Feeding it has proven to be a flat failure, and it is only reasonable that it should be so, as the seat of the trouble is not in the stomachs, but in the envelopes of the foetus and uterus, and it stands to reason that it does not get there through the mouth or the digestive organs, but through the genital organs from the posterior, and it is through these sources that we must seek relief, by applying our antiseptics directly to the seat of the trouble. You may ask, "why wait until a cow has aborted, and why not apply antiseptic agents to these parts before abortion takes place?"

We will answer, that you never suspect abortion in your herd until one or two have aborted, and just these one or two are the germ breeders for the rest of the herd, and while the uterus is still open, you can get at the interior of the same where the germs are rapidly multiplying and get a chance to destroy them, while later on this organ closes so tightly that you cannot gain access to the interior no matter how hard you try, and if a cow is once pregnant you should never try to open the uterus, for if you do you will surely cause abortion mechanically. We only prescribe the cramp bark internally, because it is a uterine stimulant, and will strengthen this organ so that it is more able to resist the attacks of the enemy. Black haw is equally as good for this purpose.

The best way to remove the placenta is by hand, being careful to unbutton each cotyledon from the placenta, then flush the uterus with a tepid solution of permangenate of potash, using a teaspoonful to an ordinary bucket of water. This will remove the small particles which cannot be removed by hand. Giving medicine per mouth will not remove the placenta after abortion in any case.

SHARES NOW 15c Each. PAR VALUE $1.00

Will advance to 20c March 14th, with another advance to 25c April 14th.

WE ARE OFFERING YOU A CHANCE OF A LIFETIME IN A PROPOSITION THAT IS WORTHY OF THE MOST SKEPTICAL.

The Four Metals Mining and Milling Company

Are mining Gold, Copper, Lead and Silver in four great mineral States,

Arizona, Colorado, New Mexico and Wyoming.

Its Officers and Directors are Men of Business Reputation and Business Success

NOT FINANCIAL ADVENTURERS

The Entire Management will Bear the Most Searching Investigation.

OFFICERS AND DIRECTORS:

President—J. R. McKINNIE, President of the *Exchange National Bank*, Colorado Springs, Colo.
Vice President—W. P. GARRISON, President of The Illinois-Colorado O. G. & C. Co., Chicago.
Secretary—A. D. AITKEN, Member of Colorado Springs Mining Stock Exchange Association, Chicago.
Treasurer—E. C. SHARER, Secretary of Pike's Peak Coal Company, Colorado Springs, Colo.
Director—M. W. SAVAGE, Proprietor *International Stock Food Company* of Minneapolis, Minn.
Director—HON. L. L. AITKEN, Member of Colorado State Legislature, Colorado Springs, Colo.

The following table shows what you can get for your money before March 14th:

$900 will buy 6000 shares, par value $6000
$600 will buy 4000 shares, par value $4000
$300 will buy 2000 shares, par value $2000
$150 will buy 1000 shares, par value $1000
$ 75 will buy 500 shares, par value $ 500
$ 30 will buy 200 shares, par value $ 200
$15 will buy 100 shares, par value $100.

If it is not convenient to pay the full amount of your subscription in cash we will accept 25 per cent with your order, 25 per cent in 30 days and 50 per cent in 60 days.

The Larger Your Investment the Larger Your Returns.

Note what you would have made on a small investment in the following companies: One thousand dollars invested in the Portland Mine seven years ago would have realized you $100,000. One hundred dollars invested in the Elkton Mine at Cripple Creek would have realized you in six months $6,000. The great Independence Mine was once offered for sale for a few hundred dollars, afterwards paid dividends to $2,000,000 per year, and was sold for $10,000,000 three years ago. There are hundreds of other companies showing the same results.

The Four Metals Mining and Milling Company owns nearly 500 acres of the richest mining property in the greatest mineral producing section of the United States. We are shipping ore now at a profit. One mine alone, which is fully equipped with modern machinery, has produced $100,000. Our other mines show at least a half million dollars worth of ore in sight. All we need now to make them heavy producers are hoisting machinery and a one hundred ton mill, and these equipments will be installed as fast as men and money can do the work, then our stockholders will receive **large dividends from their investment.** To enable us to make these improvements is the reason we are offering our treasury stock for sale. Remember we mine Gold, Copper, Silver and Lead, the greatest profit producing metals in the world. Our mining property is surrounded by mines worth millions of dollars. **When we say we are offering you a chance of a lifetime, this statement is a fact.** All that we ask is that you investigate. A postal card will bring to you our prospectus with convincing proofs that our proposition is the best on the market today. Any further information you desire will be cheerfully given.

Address: **ANDREW D. AITKEN, Secretary**

The Four Metals Mining and Milling Company.

W. M. OSTRANDER
1519 N. A. Building, Philadelphia

FOR SALE. A Good Dairy and Stock Farm of 120 acres, well watered, spring at door, a running brook through premises, well fenced, good house and out buildings, a small grove, barn nicely fixed for 22 cows, separator room attached. Am in dairying and have a nice herd of grade Jersey cows, a registered bull 2 years old, all located within one mile of town of 2500 inhabitants. A good cream trade with principal restaurant. Creamery in town. Would like to sell farm, dairy stock and all. A Bargain to the right man. **IRA D. FOTMAN**
Lancaster, Wis.

FOR SALE.

A Fine Farm in Sargent Co., North Dakota,

consisting of 7 quarter sections with lease continuing 3 years on two other quarters.

300 Acres in Cultivation. 600 Acres Enclosed in Four Pastures, Remainder Outlying Prairie.

IMPROVEMENTS.

HOUSE is very comfortable dwelling with eight rooms.

FINE BARN 101x112 feet with capacity for stabling sixteen head of horses and eighty-four head of cattle in stanchions. **Calf Stable** for twenty head and stable for young stock and box stalls for hospital purposes.

TWO LARGE SILOS inside with ninety ton capacity each, besides room for two hundred and fifty tons coarse fodder, and **Root Cellar** 24x24 feet.

CREAMERY 22x40 feet, two story with up to date machinery.

FEED MILL AND ELEVATOR 18x32 feet with bins above to hold more than four thousand bushels of grain, equipped with a **Three Roller Mill,** corn sheller, grain cleaner, elevators, spouts and hopper, and bottomed bins for convenient handling of grain. Mill is connected to creamery by a building 20x28 wherein is a

WATER WHEEL that **drives the mill and creamery,** and **boiler for steam** heating and hot water for use in creamery. This room is also used for carpenter and blacksmith shop. Within this room is also located an

ARTESIAN WELL yielding five hundred gallons of clear soft water per minute under pressure sufficient to drive the mill and creamery. It also provides

WATER IN HOUSE AND BARN and flows off through pastures making several small lakes, furnishing water on four quarter sections and finally flows off to natural water way that leads to Red River of the North.

WATER WHEEL AT BARN **furnishes power for cutting ensilage** and other purposes. There is also a

GRANARY 18x32 feet with basement now used for

ICE HOUSE The house is enclosed in a **beautiful lawn** of about **eight acres** wherein is the family garden. Several hundred fine forest trees have been planted here besides some fruit trees all of which are doing finely.

This is **one of the finest and most complete** plants for general farm purposes and for stock growing and dairying to be found in the northwest. Practical up to date farmers wanting a fine plant should investigate. For full particulars regarding the farm and its sale address

BYRON PARSONS, Evansville, Ind.

THE COMING DAIRY COUNTRY

Probably the richest farming country open for settlement to-day on the American continent, is the fine hardwood belt extending along the Minneapolis, St. Paul & Sault Ste. Marie Railway ("Soo" Line) in northern Wisconsin and Michigan. Acknowledged by good authorities on dairying to be the best dairy region in America. A land of Clover and Blue Grass well supplied with streams, lakes, and springs of pure water

W. D. HOARD, Editor of Hoard's Dairyman, says:

"I believe that northern Wisconsin is going to prove the most successful dairy region of the northwest, something like that of St. Lawrence and Lewis counties in New York.

"The peculiar salubrity of the air, the moderate heat of summer, the abundant and pure water, the good soil and luxuriant growth of grasses, all conspire to make it an ideal dairy region."

CHOICE LANDS AT LOW PRICES.

If you want a home in the "Great Clover Belt" write for free illustrated folder to **D. W. CASSEDAY, Land Agent "Soo" Line, Minneapolis, Minn.**

HARDWOOD TIMBER LANDS

from which the older trees have been cut but mostly covered with a fine growth of young timber, located in Marathon County, Centra' Wisconsin, are now offered for sale by us on most favorable terms to actual settlers.

This is some of the very best hardwood agricultural land in this state, with a deep, clay loam soil, gently rolling, with water easily obtainable at from 16 to 24 feet.

There is no better land for grain, grasses pastures, oats, peas, fruits or livestock, etc. Particulars will be furnished promptly on application.

RIETBROCK LAND AND LUMBER CO., Athens, Wis.

Dairy Business for Sale.

Operating on leased farm and distributing products direct to consumers at high prices. **Annual business over $25,000.00** and paying good profit. Stock, equipment, routes and good will offered at reasonable figure. **A Magnificent Opportunity** for individual of means and ability. Owner's attention demanded at other matters. Address "BUSINESS," care of Hoard's Dairyman, Ft. Atkinson, Wis.

Fine Dairy Farm for Sale.

Near St. Paul, Minn. 210 acres good land with ample buildings of all kinds. Page fence, cedar posts. Pure bred Holstein cattle and Yorkshire swine sell readily at good prices. Good markets for all dairy products. Will sell with or without stock and other personal property. Easy terms. Enforced removal to California only reason for selling. **T. S. TOMPKINS,**
Pasadena, Cal.

STOCK FARM BARGAIN.

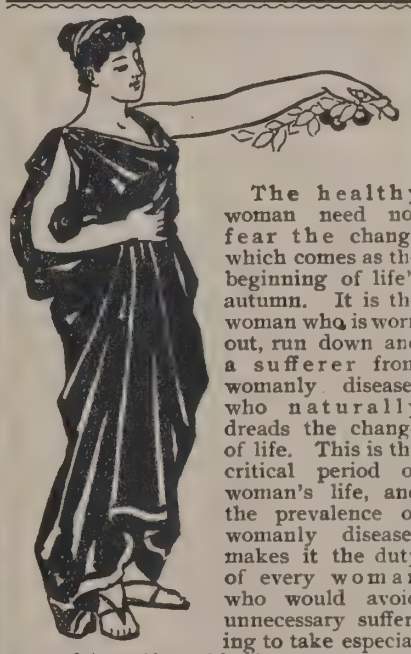
Comments and Queries from Robinswood Farm.

What Percentages of Butter Fat are to be Desired in the Economical Production of Milk for Butter Making and for Direct Consumption?

ED. HOARD'S DAIRYMAN:—The question that Mr. L. W. Peet asked in the issue of November 21st last as to the most desirable richness of milk in butter fat for economic production is a very interesting one, and one that apparently has not been given any general definite answer. I imagine that the question cannot be answered in an entirely satisfactory manner without the collection of a very much larger amount of data than has hitherto been made and collated. I know of no other avenue though which this collection of facts could be made so disinterestedly as though HOARD'S DAIRYMAN. I do not think that the decision as to this matter can be left to the various breed associations, because each one of them is composed of owners of various types of cows, to say nothing of differences of a wide nature existing between the associations themselves, for of course the Holstein champions will claim that a very big flow with a relatively small per cent of butter fat is the correct ideal.

Equally of course, and I think correctly so far as the economic production of butter fat is concerned, the Jersey people will claim that a rich per cent of fat and somewhat lesser total yield of milk is essential; while the Ayrshire advocates would naturally stand up for a medium fat percentage. I don't know just where the Guernsey folks would stand as to this question; although we know where they stand as to the color line. I am not at all certain that in our present state of scientific knowledge, we can say that the percent of butter fat in the milk has any very close relation to the whole amount of milk produced. We know as a rule that the greatest butter makers have been rather deep producers of quite rich milk. A discussion of the influences which effect large butter fat percentages in cows is a separate story, and I will here confine myself to a consideration of the query embodied in the heading.



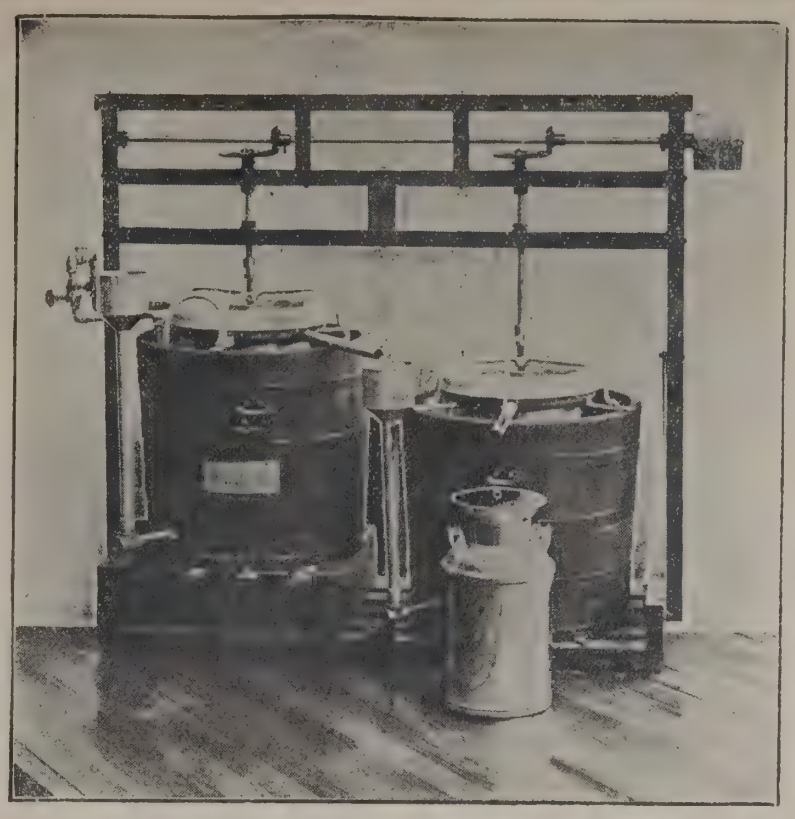
There are certain general laws which have some relation to the matter. We know that when a cow is giving her greatest flow she is producing the most butter fat, although at that time, as a rule, her milk shows the lowest percentage of butter fat. The amount of butter fat a cow can produce seemingly depends, in a large degree, on the amount of fats and carbohydrates she can digest and absorb, the proteins having comparatively little relation to this specific, fatty production. As a secondary influence determining the amount of butter fat produced, we have peculiarities of temperament and disposition in the animal as they relate to facilitating a formation and disposition of fat or its nonformation through the oxidation throughout the general system of the food constituents, from which the fat is formed, as for example in excitable, restless animals. As a third set of influences we have to consider the quantity, as well as the quality, of the blood which may be distributed through the udder, and this influence includes the proportionate strength of heart action. And fourth, we have the intensity of functional activity of the milk cells themselves, the degree of which is regulated by the development of the nerve centers of the cerebro-spinal and sympathetic nervous systems.

I think that it cannot be denied that mammary protoplasmic activity may be so intensified by high protein feeding that the protoplasmic contents of the cells are so enlarged as to prevent absorption in sufficient quantity by the cell of the elements needed for fat formation. This reason is outside of the fact that a blood current may be so loaded with protein as to prevent a due proportion of fatty and carbohydrate currents from passing into the milk cells. The whole conjunction of conditions which conduce to the presence of the most desirable percentages of fat in the milk and which include cost of feed under special conditions, is so complex that I do not think that any generally acceptable determinations can be arrived at as to the most desirable percentage. What would be the best under one set of conditions would not be so in other cases. We must usually judge the matter in relation to special conditions and always with reference to the particular case in hand.

A cow that is suited to the heavy feeding of cheap protein, as in alfalfa regions, is not just the right cow for a light and rather broad ration. Some cows may have great powers to produce fats simply because of high digestive power for protein and a deep milking capacity, and yet whose percentage test is small. Such cows may be profitable to keep when protein feed is cheaply secured, but would be unprofitable servants in other localities. Other things being equal, and in most situations, the more butter fat that a cow can produce with the least use of protein the more profitable is she to be considered, though it must not be forgotten that a certain narrowness of ration is needed for heavy work. Those cows that through climatic and other influences have developed functional pecularities which conduce to large fat percentages, though with a somewhat lesser production in the quanity of milk produced are those which make butter fat most economically.

Nevertheless it is frequently a better policy to make more pounds of butter at a greater cost per pound than to produce fewer pounds at a lesser cost per pound The cow best suited to do the work should be created in harmony with the policy adopted. So far as I can see, the only way to handle this matter practically is to feed the cows protein to the greatest extent, up to the point where they show an unprofitable return, a point that can be determined by the weighing of the milk from each and the Babcock test, and with proper regard to the health of the animal. This latter point is a matter that must be carefully considered; for if health is being undermined, productive evolution should be stopped. My opinion is that when a sufficient number of statistics has been collated, it will be found that as a general rule, the amount of fat in the milk that will be found most profitable will average through the whole year between four and five per cent, say, ranging from four to six per cent, during the different stages of lactation.

There is no reason, so far as health is concerned, why the breeder should not strive to secure in a butter cow as large a percentage of butter fat in her milk as is possible. The influences which conduce to very large percentages, do not conduce to very deep flows; and it is only when very heavy continued flows occur that danger to constitutional strength ensues. The amount of heat and energy

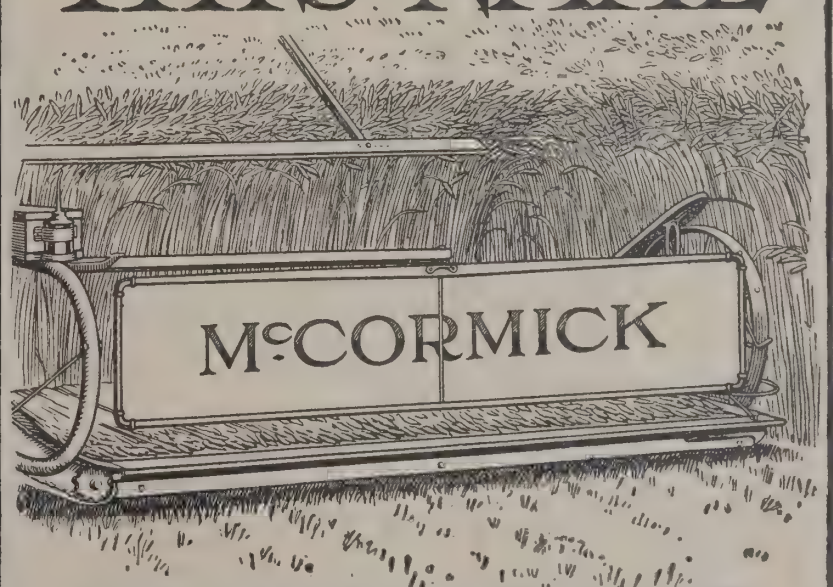


The healthy woman need not fear the change which comes as the beginning of life's autumn. It is the woman who is worn out, run down and a sufferer from womanly diseases who naturally dreads the change of life. This is the critical period of woman's life, and the prevalence of womanly diseases makes it the duty of every woman who would avoid unnecessary suffering to take especial care of herself at this time.

The ills which vex so many women at the change of life are entirely avoided or cured by the use of Dr. Pierce's Favorite Prescription. It makes weak women strong, and enables the weakest to pass through this trying change with the tranquility of perfect health.

"I have been a very healthy woman, and this time has been very hard with me," writes Mrs. Maggie Morris, of Munson Station, Clearfield Co., Pa., Box 16. "I am come to the time of change of life, and I have been sick a great deal of and on. When Mrs. Hemmis moved beside me I was sick in bed, and when she came to see me and we were talking over our sickness, Mrs. Hemmis told me to try Dr. Pierce's Favorite Prescription and 'Golden Medical Discovery,' also 'Pellets.' I got her to bring me a bottle of each from the drug store and I used them. They did me a great deal of good, and I got two more bottles of 'Favorite Prescription.' I never saw such a wonderful cure. Before I commenced your remedies I was good for nothing; was in such misery I hardly knew what to do with myself, now I can do all my work myself and feel well."

Dr. Pierce's Pleasant Pellets are easy and pleasant to take.



A GREAT SUCCESS.

The Miller Cream Pasteurizer has a capacity of from 450 to 600 lbs. per hour.

Price $150 in Tin. $200 in Copper.

THE MILLER PASTEURIZING MACHINE CO.
CANTON, OHIO.

THIS NAME

IN THE GRAIN

is a guarantee of a speedy and successful harvest. Time is money to every farmer and is always worth more when the grain is ripe than at any other season of the year; therefore, it pays the farmer well to own the McCormick—the binder that not only saves his grain, but also saves his money in saving his time.

"A MODEL MACHINE"

is the title of the McCormick book for 1903. If interested in machines write for it.

ADDRESS NEAREST McCORMICK BRANCH,
EAU CLAIRE, WIS. GREEN BAY, WIS. MADISON, WIS. MILWAUKEE, WIS.

creating food consumed in the production of even a very large production of butter fat is a relatively slight matter under good conditions of protection, care and intelligent feeding; but when there is a very heavy draining away through the udder of the other elements of milk (i. e., the protein and mineral constituents) then constitutional damage is likely to ensue.

The influences which tend to create very large milk flows and very great fat percentages are so diverse, that we have to conclude in this, as in other things, that specialization must prevail to secure the best results. The breeder who attempts to secure both conditions in one cow, is pretty sure to fail, through a dual aim, whether he is using cross breeds or thoroughbloods, and is likely to secure a small flow as well as a low per cent of butter fat through lack of singleness of aim, and hence, through lack of intensity of influence brought to bear on the desired aim. It is strange that this fact has not been generally recognized before this, in striving for the creation of a milkman's cow, where the ideal for a good milk for direct consumption should be of about three and one-half per cent of small globuled butter fat with a moderately deep flow—a condition frequently found in the Ayrshire breed; but which condition has been badly mixed and damaged through breeding for beef and fad udder and teats. I do not know of anyone who seems to have made a business specialty of breeding up a right strain of cow for the milkman. I have seen some individuals among the Ayrshires of the right type, and if I wanted to breed for the aim referred to, would base my work on the Ayrshire breed.

New Hampshire.

Dehorning Cattle.

ED. HOARD'S DAIRYMAN:—I see in your issue of January 23, 1903, on page 1065, the Dehorning of Cattle Recognized in Australia as Cruelty to Animals. I was once of that opinion, but by looking around and seeing how stock will horn each other I now think it a merciful operation. I had an old Jersey cow get one horn broken off the other day. I think that was more painful than to saw it off; and last fall I saw at the Sedalia Fair there were several Jerseys with the shell slipt off of the horns or one horn. Now I think that it is much more painful than to saw the horn off and the cow would look much better than with horns on. In fact I don't see that our cattle have any use for horns only to do harm.

I bought a steer of my neighbor and he hooked another steer of mine in the flank and let his bowels out and the steer died Then I sold him to my brotherinlaw and the steer hooked a cow of his in the flank and let her bowels out and she died. Then he fattened him and when he shipped him I went with the car and saw the steer go up and down in the car and just made the other cattle bellow.

Now wasn't that cruel? It is no more painful to take the horns off then to castrate a steer, but the right way to dehorn is to do it when the calf is first dropped. Just after it has sucked itself full and laid down to sleep, then go to it and hunt for the little button. You will find a little bare spot where the horn will come and just wet that spot with a little caustic potash, or this common box lye that they make soap of, is just as good. Wet that little button and the calf won't wake up under the operation and the horn will never start to grow. Now if this is cruelty to animals I would like to know why? I think that every calf ought to be done that way, but a still better way is to breed them off with hornless males, Polled Jerseys and Polled Shorthorns, Red Polls and so on. WM. H. B.

Concordia, Mo.

Silage Compared with Timothy Hay.

Will you please tell me the value of good corn silage as compared with timothy hay? P. J.
Wayland, Mich.

Timothy hay of average quality contains 49.4 per cent digestible units. Silage of average quality contains 17.1 per cent digestible units. If this was the only test of value, timothy hay would be worth nearly three times as much as silage, but timothy hay is not so easily digested as silage and quite a proportion of its digestible value must be used in furnishing energy to digest it, whereas silage is easily digested and, therefore, requires less expenditure of energy for this purpose. Again, silage is a succulent feed and there is a value in succulence which cannot be measured or even estimated in figures.

Early Ripe Fodder Corn.

This corn has leaped with one wild bound into popularity and nothing that we have ever sold has given such great satisfaction. Everywhere throughout the United States, where SALZER'S EARLY RIPE FODDER CORN was planted, it surprized and delighted, and pleased and astonished the grower.

It Was Ripe in 60 Days

and furnished magnificent feeding Corn just at a time when farmers were short of Corn. If you plant this early, you will have fine feeding Corn by July, when you can replant same and have good Fodder Corn in September. This is the most wonderful Ensilage Fodder Corn in the world. Our catalog gives full description.

Salzer's Superior Fodder Corn.

This variety is late, but it's the greatest Fodder Corn on earth. Here are two testimonials from wide-awake farmers that will tell you what they think of this remarkable Fodder Corn. It is far ahead of such varieties as B. and W. corn, when big ears, full ears, and lots of them, together with enormous quantities of leafy, rich Fodder are desired:

Chas. E. Brandel, Truesdell, Kenosha county, Wis., says: "The Salzer Superior Fodder Corn that I got from you last spring is truly a great and wonderful Corn. I planted it the latter part of June and some of it nearly ripened before the early frosts. There are two big ears on almost every stalk, and if it had been planted earlier, there would have been magnificent Corn, thoroughly ripened."

"Racine, Wis., Sept. 14—Out on my farm we planted nearly five acres of your Salzer's Superior Fodder Corn, and it is a sight. From one square rod we cut and bound 450 lbs., and this, I believe, is at the rate of 36 tons (72,000 lbs.) per acre.—C. C. Beebe."

OTHER FODDER PLANTS. Salzer's Catalogue is brim full of rare Fodder plants for the dairy. There is nothing in the world better than Salzer's Teosinte, yielding 100 tons of green Fodder per acre, Salzer's Billion Dollar grass, with its 12 tons per acre, and Salzer's Thousand Headed Kale, Dwarf Victoria Rape, Bromus Inermis, Kaffir Corn, Sand Vetch, Jerusalem Corn and the Giant Spurry are but a few of the things found in Salzer's Catalogue.

FOR 8c. If you will mention HOARD'S DAIRYMAN when you write, we will send you a sample package of the Earliest Ripe Fodder Corn and Salzer's Superior Fodder Corn, the two best Fodder Corns on earth, together with our great Catalogue, well worth $100 00 to the wide-awake dairyman and farmer.

JOHN A SALZER SEED CO., LA CROSSE, WIS.

An Interesting Advertisement

AND WHAT WILL COME OF IT

In a recent issue of a very prominent publication, I published an advertisement which read as follows:

"A SAFE INVESTMENT: Those who have modest sums saved for a rainy day, and who don't want to lose in uncertain ventures, yet who are willing to investigate an enterprise, that is conducted on honor and with every guarantee of certain profits, will learn something of interest and to their profit by addressing E. M. Armstrong, Chamber of Commerce building, Chicago. Gilt edged references in abundance."

I received a number of inquiries in answer to this announcement. The advertisement states nothing about the character of the investment, for I depended entirely upon the faith that the readers had in the publication, and confident that they would understand that no advertisement that had behind it any unreliable or improper motive could appear in the columns of this paper for any money and I wasn't disappointed in the result.

To tell you in an advertisement all about the investment in which I am interested would take too much space and cost too much money, but I will say this, that it is one of the safest investments that has been recently offered to the public and it will bear the most rigid investigation, and will pay those interested large profits for many years to come, at least calculation twenty years. I myself have invested practically all that I have in the world in the enterprise. It involves tens of thousands of dollars on my part and will make me very wealthy. A limited amount of stock is offered for sale by the directors and a few investors can be accommodated.

It is an enterprise that is endorsed by many of the most reliable and best posted business men in the country. The members of the Directory Board comprise men who would not under any circumstances allow their names to be used in connection with unreliable ventures.

FOR THE STOCK YOU WOULD SEND YOUR MONEY TO ONE OF THE SOUNDEST BANKS IN THE WEST who is the depository of the company. These points I mention that you may appreciate that the enterprise is on the soundest basis and that you would be doing business with parties whose statements are reliable.

It does not matter whether the amount you have to invest is $50, or $500, or even more. This proposition will repay you many times for the trouble of writing for further particulars and for your convenience I attach a coupon, which please sign your name to and address to me in an envelope under a 2c stamp. If you do not wish to mutilate your paper you need not cut out the coupon, but address me by letter or postal.

E. M. ARMSTRONG
322 Chamber of Commerce Bldg.,
CHICAGO.

E. M. Armstrong, 322 Chamber of Commerce Bldg., Chicago, Ill.
Dear Sir: Please send me full particulars of the reliable investment. It being understood that I am under no obligations to invest unless I choose to do so of my own free will.

"ADVERTISEMENT."

KNOWS NO DISTINCTION.

Rich and Poor Alike Suffer From Catarrh in This Climate.

All observant physicians have noticed the enormous increase in catarrhal diseases in recent years, and the most liberal and enlightened have cheerfully given their approval to the new internal remedy, Stuart's Catarrh Tablets, as the most successful and by far the safest remedy for catarrh yet produced.

One well-known catarrh specialist, as soon as he had made a thorough test of this preparation, discarded inhalers, washes and sprays and now depends entirely upon Stuart's Catarrh Tablets in treating catarrh, whether in the head, throat or stomach.

Dr. Risdell says, "In patients who had lost the sense of smell entirely and even where the hearing has begun to be affected from catarrh, I have had fine results after only a few weeks' use of Stuart's Catarrh Tablets. I can only explain their action on the theory that the cleansing and antiseptic properties of the tablets destroy the catarrhal germs wherever found because I have found the tablets equally valuable in catarrh of the throat and stomach as in nasal catarrh."

Dr. Estabrook says, "Stuart's Catarrh Tablets are especially useful in nasal catarrh and catarrh of the throat, clearing the membranes of mucus and speedily overcoming the hawking, caughing and expectorating."

Any sufferer from catarrh will find Stuart's Catarrh Tablets will give immediate relief and being in tablet form and pleasant to the taste, are convenient and always ready for use as they can be carried in the pocket and used at any time as they contain no poisonous drugs, but only the cleansing, antiseptic properties of Eucalyptus bark, blood root and Hydrastin.

All druggists sell the tablets at 50 cents for complete treatment.

Growing a Balanced Ration.—A Missouri Inquiry.

I see a great many dairymen write to you for instructions as to balanced ration of the feed they have on hand. I am writing today to know what to plant.

I have 20 acres in permanent pasture, 22 acres for field corn, about 6 acres for sorghum, about 14 acres for oats and clover or Canada field peas, about 4 acres for sweet corn and about 58 acres in clover and timothy, fine stand. I have just started in the dairy business and I wish to get started right. Now the above is my idea. What do you think of it, can you improve on it?

Bran $14.00 a ton. Would you advise sowing the oats and clover at the same time, or would you advise sowing half the 14 acre field in clover alone and the other half in oats alone, and if I failed on either or both, I could then put in peas. I will gladly listen to any change you have to make on any of the other fields.

I am running about 10 cows and I do not wish any more than that for the reason with that many I can do the most of my other work on the farm, good help is very scarce. Sell my milk right at the door, at 14 cents a gallon.

Please give me a balanced ration. I enclose stamp for reply. I am a new subscriber for the DAIRYMAN.

When my new crop comes in I expect to keep track of everything eaten by the cows.

Hannibal, Mo. N. J. L.

We cannot spare the time from other pressing duties to answer inquiries by personal letters, but must try to make all answers of more or less general interest for all readers. Moreover this inquirer gives us no information as to the feeds he now has on hand or can obtain, and it would be too much of a wild guess to suggest a formula by choosing feeds at random.

The inquiry as to best crops to raise is more specific, but even here we are more or less at sea, for the reason that 10 cows cannot consume more than about a quarter of the feed that ought to grow on the areas specified. There should be a good deal more stock kept on this farm or it will rapidly deteriorate in fertility. The most wasteful style of farming is raising hay for sale, and next to it is selling grain. It is much better to feed the hay and straw to stock and if any grain is sold, purchase other feed to take its place.

There is some doubt in our minds whether the Canada field pea will do well in the climate of Missouri, even if sown early in the spring, and almost certain failure can be predicted for this crop when sown in midsummer. It would be much safer, we think, to substitute the southern cow pea and sow with corn or sorghum. Also, we advise making a trial with two or three acres of alfalfa concerning which and the methods of raising, more will be said in the near future. It is all right to try half of the 14 acres with clover alone, but we would sow clover with the oats. If either of these should fail, a crop of cow peas could be raised, and these with clover hay and silage would go far toward furnishing the material for a balanced ration.

An Opinion on Cross Breeding.

ED. HOARD'S DAIRYMAN:—I notice considerable information published recently about cross breeding, and as I have had twenty years experience, it may probably be interesting to others. I have paid up to $1,000 for horses, $500 for cattle, good big prices for sheep, hogs and chickens, all generally of good pedigreed stock. Have tried cross breeding in its many ways, and with few exceptions, have obtained nothing but scrubs, and never in any one instance an improvement on the original stock. Five years since I quit this foolishness, and nothing now for me but good stock in its own breed. Fortunately, I was so fixed that I carried the idea of cross breeding as a fancy, regardless of profit or loss. Can see where limited means would result in sure financial failure, together with the degenerated scrub stock as a result.

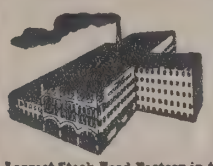
ENGLISH STOCKMEN LIKE

3 FEEDS FOR ONE CENT

WESTON COYNEY HALL,
Nr. Longton.

International Stock Food Co., STAFFORDSHIRE, ENGLAND.
Minneapolis, Minn.

DEAR SIRS:—I have pleasure in handing you remittance to cover your invoice for **"International Stock Food."** I have given it a thorough trial on my horses, both drivers and draft, and I find it justifies all you claim for it in every way. All my stock are in exceptional condition this year and this I attribute to the use of **"International Stock Food."** I tender you my sympathy for the loss you have sustained by the death of Online 2:04, a loss which will be felt by the whole of your district. I had great success in my experiment of crossing the French Coach Horse with the American Trotter, the result being a fine heavy harness horse. I am, sirs, Yours faithfully,



F. J. RIDGWAY.

We will Pay you $1,000 CASH to Prove that our Testimonials are not Genuine.

"INTERNATIONAL STOCK FOOD" 3 FEEDS FOR ONE CENT is Prepared from Roots, Herbs, Seeds and Barks and Won the Highest Medal at Paris Exposition in 1900 as a High-Class vegetable, medicinal preparation to be fed to stock in small amounts as an addition to the regular feed. It is a Great Aid in Growing or Fattening stock because it increases the appetite and Aids Digestion and Assimilation so that each animal obtains more nutrition from the grain eaten. We positively guarantee that its use will make you extra money over the usual Plan of Growing and Fattening stock. "International Stock Food" can be fed in safety to Horses, Cattle, Sheep, Goats, Hogs, Colts, Calves, Lambs or Pigs. It is Absolutely Harmless even if taken into the Human System. You insist on eating medicinal ingredients with your Own food at every meal. Salt is a stomach tonic and worm medicine, Pepper is a powerful stimulating tonic, Mustard is a remedy for dyspepsia, Vinegar is a diuretic. You eat these medicinal ingredients almost with every mouthful of your food, and it is proven that these condiments promote health and strength for people and improve their digestion. **"International Stock Food"** contains pure vegetable medicinal ingredients that are just as safe and as necessary an addition to the regular feed of your stock if you desire to keep them in the best possible condition. **"International Stock Food"** is endorsed by Every High Class Farm Paper. It purifies the blood, stimulates and permanently strengthens the entire system so that disease is prevented or cured. **"International Stock Food"** is sold on a **"Spot Cash Guarantee"** by Fifty Thousand Dealers throughout the World. Your Money will be Promptly Refunded in Any case of failure. It will make your Pigs or Hogs grow Amazingly and has the largest sale in the World for curing or preventing Hog Disease. Beware of the many Cheap and Inferior Imitations! No Chemist can separate all the Different powdered Roots, Herbs, Barks and Seeds that we use. Any One claiming to do so Must be an Ignoramus or Falsifier.

Plano Binder

It's simple; free from needless complications; has handy operating levers; works easily every way.

For over twenty years our experts have studied this machine; planned out a rigid and enduring frame; discovered how to use a lever in place of several cog-wheels; equipped the reel with a self-acting friction clutch which prevents breakage; applied the stored power of a self-regulating fly-wheel to equalize the draft; perfected the simplest Knotter yet devised, one that holds the world's record for accurate tying. In short, they have fitted this machine for the greatest practical field service anywhere.

The Plano catalogue describes it, and tells about some other interesting cash and labor savers; ask for a copy.

CLIP YOUR HORSES

with 20th Century Clipper PRICE ONLY **$5**

They feel better, look better, work better, and are less liable to catch cold. Don't let your horses stand in the barn all night with a heavy damp coat of hair on. It weakens them and they lose flesh. If clipped they dry out quickly, gain flesh and can be groomed in one fourth the time. Weighs only 15 lbs. Clips a horse in 30 minutes. Send for Catalogue H

CHICAGO FLEXIBLE SHAFT CO.,
194 Ontario St., CHICAGO, ILL.

THE WEAR OF RUBBER BOOTS AND SHOES DEPENDS UPON THE RUBBER IN THEM.

There is absolutely no wear in any of the other ingredients of which they are composed. Every time the quality of Rubber Boots and Shoes is reduced 10 per cent., the durability is reduced over 20 per cent. because there is only one way to cheapen them, and that is to leave out Rubber and put in its place other things that have no wearing quality whatever. This cheapening process has been steadily going on for the past 40 years.

THE

BUCKSKIN BRAND

OF RUBBER BOOTS AND SHOES

are made of real rubber—and one pair of them will outwear two pairs of the standard first grades now on the market. Try a pair and be convinced. Made in Duck Boots, Duck rolled edge Overs for Socks, and Felt Boots and in Arctics and light rubber shoes.

Insist on getting the **BUCKSKIN BRAND.** None genuine without the word **BUCKSKIN** on the top front of the legs of the boots and the bottoms of the shoes.

If your dealer does not keep them write us and we will see that you get them either through some dealer in your town or from us direct. We will also send you a very interesting catalogue profusely illustrated, which describes the making of Rubber Boots and Shoes from the gathering of the rubber to the finished goods.

MONARCH RUBBER CO.,
730 Bittner St., ST. LOUIS, MO.

NOT MADE BY A TRUST.

An actual test of a 2-inch strip cut from the sole of the **Buckskin** Boot. Note the elasticity and strength. Only the best Rubber will stand a test like this. Weight of boy and swing 110 lbs.

BRANCHES: Kansas City, Mo.; Minneapolis, Minn.; Waterloo, Iowa; Omaha, Neb. St. Louis, Mo. and Cowansville, Quebec.

Test the Capacity

WHEN you buy a **Sharples Tubular Separator** you not only get a separator that skims more closely than others, runs easier than others, is more convenient than others, and wears better than others, but you get a machine that will do more work for you than is claimed for it. In other words, the **Tubular** will always skim more than its rated capacity, therefore you get more for your money than is promised you.

You can buy cheaper separators than the Tubular; that is, cheap in price but not in value. They are sold cheap because they are cheap; cheap in construction, cheap in principle, and must be sold cheap or not at all. However, when you **test the capacity** of these cheap machines you find that you did not get what you thought you were buying. The **Tubular** costs a little more perhaps, but **it's worth more** and you get more value for your money when you buy the **Tubular** than you do from any of the cheap separators. **Quality** and **Capacity are what count.**

A Substitute for a Barn.

ED HOARD'S DAIRYMAN:—As I was reading the article in the DAIRYMAN by F. I. Chapman, where he spoke of the DAIRYMAN being only for the rich, the thought occurred to me that if the dairymen of small means would speak out oftener, they would be more beneficial to them.

With your permission I will give a little of my experience, being on a rented farm with no barn for cows. So I have made a shed of poles covered with wheat straw, and enclosed on west, north and east, also with straw and southwest corner boarded up for about 12 feet. Inside I have made double stalls about 8 feet wide. Behind each stall I fastened a rail crosswise just giving cows room to lie down comfortably. In front I have made a manger about four feet long, and wide enough to hold hay for two cows. I allow the space where cows lie to fill up with straw bedding, the droppings falling outside the rail, the cows keep reasonably clean.

For ration am feeding an average of 15 lbs. bran, 1 lb. linseed meal per day with what alfalfa hay and corn fodder they will clean up.

My cows are comfortable and contented even in zero weather. As to results, one cow 6 years old, fresh 8 months, gave me last week (7 days) 123½ lbs. milk. One heifer (first calf) 107 lbs. My other cow I bought 9 weeks ago; calf had been running with her till six months old. When I brought her home she gave me one-half pint the first day; last week she gave 72 lbs. Will drop her third calf about May. My alfalfa hay was damaged by wet weather, or I would not be feeding so much grain.

Have been reading DAIRYMAN only a year, but am getting much good from it.

Ottawa, Kan. IRA R. COE.

A New York Herd Report.

ED. HOARD'S DAIRYMAN:—I enclose a report of my work with a dairy of 33 grade Jerseys for year beginning Jan. 1, 1902, to Dec. 31 of same.

Average number cows in milk	33
Of which 10 or ½ were 2 and 3 year olds	
Total amount received from creamery	$1940.15
Average test	4.4
Average earning per cow	$58.78+
Cost of grain fed per cow	10.25
Total lbs. milk	171657
Average per cow	5201+
Average price per 100 lbs. of milk	$1.13+
Allowing 10 cents per 100 for skim milk would give, per cow	5.20
Total earnings per cow	63.98

To be sure, this is not as good a report as some make. but I thought it would not leave me in the rear rank.

A STUDENT OF THE DAIRYMAN.

Java Village, N. Y.

How to Get the Best Results from Skim Milk.

ED. HOARD'S DAIRYMAN:—I cheerfully accept your criticism and know full well that greater power is needed for a large machine than for a small one, and shall only claim equivalent power for the cow. To produce power, fuel is required, and it is now claimed that even water is fuel, and is not feed fuel? If this is answered in the affirmative, then the best and most appropriate kinds will make the most milk.

My real object in this is to say something of a certain kind of feed, which is skim milk. There have been articles in the DAIRYMAN from several who have written of its merits, some valuing it much higher than others. But I have not learned as to the manner or methods employed by those who got the large results, or rather, what ingredients, if any, that were used with the milk. Mr. Plato, of this state I think, got the best results, but evidently has some secret as to what he uses and perhaps thinks it too good to make known.

I will go a little farther than others as to what I think essential, which is to put back, after the milk has been through the separator, the constituents removed, with feeds supplying the deficiency, quite possibly with much cheaper material. Is it unreasonable to suppose that if this is done, that as good results can be obtained as from the milk direct from the cow. Have we got to call on Prof. Henry or some one else that is authority on feeds for an answer to this, or, is it going to be some one who, by practice and experience, has solved the problem. When this shall have been accomplished, I will accept as facts, what now looks like exaggerated statements, of the growing and fattening of calves.

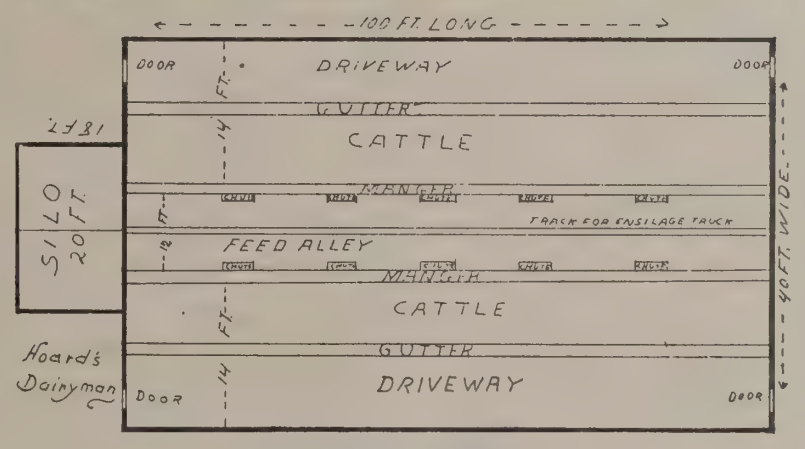
Barn of G. E. Beakes, Delaware County, N. Y.

Ed. Hoard's Dairyman:—The photo. and diagrams show the plan of the dairy barn on the farm of G. E. Beakes, Delaware Co., N. Y. This barn accomodates 60 cows, and is planned for caring for them with the greatest convenience. It is also warm, well ventilated, and has the Buckley water buckets, which are filled by a spring of running water which was brought to the barn. The stable is made frost proof by double walls, with a dead air space between.

Ensilage from the large silo, holding 140 tons, at the end of the barn, is thrown in to a large car, or truck, and is pushed along the track in the feeding alley, and taken out with a basket and distributed in the mangers on either side. The feeding alley between the stanchions is 12 feet wide and 8 feet between the mangers. The floor between the mangers is raised 18 inches. The chutes for hay and grain are conveniently arranged on the sides of the alley, next to the mangers.



The two drive-ways are very convenient for drawing out the manure every day, which is done all winter, the gutters are tight, and no part of the manure is wasted. It will be noticed that on the second floor, the tread power is close by the silo, and that the corn does not have to be elevated but little to the top of the silo. The bridges from the two driving floors, in the second story, to the ground, are not shown in the photo. The silo is divided in the middle. A car load, or more of grain can be easily unloaded in the large bins on the second floor, from the drive-way, and the bins are also convenient for receiving the grain, when it is threshed on this floor. A horse fork is used for filling the large bays which hold 100 tons or more of hay. The hay is pitched down the chutes in the feeding alley, close to the mangers.

This barn is 40×100 feet, the posts are 32 feet long, and the basement is 9 feet high.

Bylaws of a Co-operative Creamery—Does Salt add Weight to Butter.

Ed. Hoard's Dairyman:—Will you kindly say through your valuable paper, what per cent, if any, is added to the weight of butter when one ounce of salt is used to the pound.

Also where can we obtain a practical set of Bylaws for a co-operative creamery.

Camp Point, Ill. W. T. K.

If butter is worked very dry before the salt is added, there may be an increase in weight, but under usual conditions there is a loss in weight.

1. This association shall be known as the————Co-operative Creamery Association.

2. The purpose of the association shall be to locate, establish and carry on the manufacture and sale of milk products, in such a manner as will conduce to the greatest convenience and profit of the producers over the greatest amount of territory in the town of————and vicinity. Also to purchase, use, and hold real and personal estate necessary for the transcation of the business of the association.

3. The capital stock of the association shall be————dollars, divided into——shares of ten dollars each.

4. This association shall be co-operative. Cream or milk may be purchased or accepted from any person not a stockholder on the same terms and conditions as may be prescribed for stockholders.

5. Any person directly engaged in agricultural pursuits may become a member of this association by taking one or more shares of the stock of the association.

6. 1st. The regular meetings of the association shall be held semi-annually, viz., on the first Mondays in——and——in each year, at such time and place as the Board of Directors may determine; and notice of such meetings shall be given by the clerk to each member by mail seven days at least previous to the date of said meeting. 2 Special meetings may be called either by the president, with the advice and consent of a majority of the directors, or upon written request of one-third of the stockholders of the association, upon seven days' notice as above. 3. Meetings of the Board of Directors may be called by the president or by any two directors.

7. 1st. The officers of the association, shall consist of a president, clerk, treasurer, five directors and two auditors. 2nd. The president shall be chosen annually by the board of directors, by written ballot, at the regular meeting in October. 3d. The clerk, treasurer, board of directors and auditors shall be chosen by the stockholders annually by written ballot, at the regular meeting in Oct., and all officers shall hold office until others are chosen and qualified in their stead. Vacancies in the abovenamed offices may be filled at any meeting of the stockholders; in the meantime by the board of directors. In case of the absence of the clerk a temporary clerk may be chosen and qualified in his stead.

8. At any regularly called meeting of the association, nine of the members thereof, and at any meeting of the board of directors, three members thereof, shall constitute a quorum for the transaction of business. A less number may adjourn from time to time.

9 It shall be the duty of the president, who shall be a director, to preside at all meetings of the association and of the board of directors, preserve order therein, put all questions, announce all decisions, and, in case of an equal division to give the casting vote. He shall receive and safely preserve all bonds required of officers of the association and sign all certificates or documents issued by the association or board of directors. In the absence of the president, it shall be the duty of one of the board of directors in order of their seniority, to preside at any meeting.

10. It shall be the duty of the clerk to attend all meetings of the association and of the board of directors, and to keep a correct record of the same, which record shall be open for inspection of any member. He shall give notice of all meetings and of all appointments on committees, to each member thereof, and to each officer chosen, of his election; and shall serve all such other notices as appertain to his office or as may be directed from time to time by the association or board of directors. He shall attest all certificates or documents issued, signed by the president, shall file all bills and reports and such other documents as may be ordered to be filed, and shall carry on all such correspondence as may be directed; shall act as secretary of all committees when called upon; shall keep a correct financial account between the association and its members, and shall have charge of all property not otherwise disposed of. He shall give such bonds for the faithful performance of his duty, and receive such compensation for his services, as the board of directors may determine.

11. It shall be the duty of the treasurer to receive all money belonging to the association, giving his receipt therefor. He shall draw all money for the payment of claims against the association under the direction of the board of directors. He shall make a report to the board of directors at such times as they may require. He shall perform all duties required of him by the laws of the Commonwealth, and shall give such bonds for the faithful performance of his duty as the board of directors may require.

12. It shall be the duty of the board of directors to attend to the general affairs of the association, invest the funds of the same, appoint such other agents and officers as in their judgment the interests of the association require, and fix all compensations. They shall keep or cause to be kept a correct account of all cream or milk furnished by stockholders or patrons and a correct account of all sales. They shall prescribe the rules and regulations governing the collection and delivery of the cream and milk; may cause the quality of the same to be tested as often as may be deemed expedient; may authorize the premises of any stockholder patron to be inspected, and may reject and refuse to collect or receive any cream or milk that is unsatisfactory or not furnished in compliance with the prescribed regulations. They shall establish prices and have full power over the business of the association, and shall in all cases pursue such measures as in their judgment will tend to the best interests of the association. They shall make a full report of their doings, and a full statement of the business at each regular meeting, or whenever called upon to do so by vote of the stockholders.

13. The duties of the auditors shall be to audit all accounts of the association, making a report to the board of directors at the time of the regular meetings, and such other times as they may require.

14. The net profits of the business of the associatlon, after such deductions have been made as the laws of the Commonwealth require, shall be divided pro rata among the stockholders, according to the number of shares held by each. (Note—If is understood that the profits shall not exceed 6 per cent on capital, all receipts in excess of this sum and necessary reserves being declared in payment to patrons for cream or milk furnished.)

15. 1st. Any person doing business for the association or incurring expenses therefor shall receive a just remuneration for such service or expense. 2nd. All documents issued by the association shall bear the seal thereof, said seal to be in charge of the clerk. 3rd. The directors shall procure a corporate seal. 4th. No member of the association can transfer his stock to any person not directly engaged in agricultural pursuits. 5th. In case shares are transferred by one person to another, the certificate thereof, must be surrendered to the treasurer, and the board of directors shall cause another certificate to be issued to the person to whom the transfer is made.

16. These by-laws shall not be altered or amended unless such alteration or amendment be proposed in writing one meeting previous to action being taken; provided also, that two-thirds of the members vote in the affirmative.

Loading a Heavy Hog.

Ed. Hoard's Dairyman:—Sometime ago I had quite a heavy hog I wished to

take to market. I backed my sleigh up to the hog pen door and tried to load the hog, first by coaxing, then by compelling, but neither one availed. Strength on my part was getting exhausted and seeing a neighbor passing, I called for help. "Give me a pail," said he, "and we'll have that hog on the sleigh in no time. Get her head in the opposite direction from what you want her to go, then you take a stick and steer and I will hold the pail over her nose." Well, it didn't take a minute for that hog to back onto the sleigh. D.

Pierpont Manor, N. Y.

Theo. Louis and his Hog House.

A Reply to J. A. M.

ED. HOARD'S DAIRYMAN:—How thankful I am that, after using my hog house over a quarter of a century, and thinking it fairly successful, and being foolish enough to think that it was right that one should clean out hog house and feeding floors daily; that one should use plenty of straw and other refuse material in the front yard of each stye, separated by moveable fence panels as the occasion would require, after it has served for bedding, first to induce hogs to use it as privy, but next, and of vast importance, to save by composting the most valuable grain fed manure, that has brought up a sandy soil so high in fertility that clover grows, so that men like Prof. Shaw, John Gould and others had but words of commendation—how thankful I am that one has arisen competent to point out the matters in which I have been at fault.

Being only a silversmith by trade, we had to learn as we went, ever reading and inquiring of those better informed.

We cleaned out horse and cow stables daily, and of course thought it was right to treat the hog house in the same way, and had the audacity to recommend such a house as we had found fairly satisfactory, but with such additional improvements as experience suggested, to the swine breeders at large, upon the urgent invitation of agricultural editors.

But an old fogy of 73 summers had never dreamed or thought that hogs in the nineteenth century ought to have privy and water closet, so we beg pardon of all that have been so disappointed in building after our model. However, Mr. J. A. M., from Prince Edward Island, will undoubtedly give vent to improvements that will remedy matters to some degree.

One of Iowa's largest and most successful swine breeders, the Hon. John Cownie, in a lecture before the Kansas State Board of Agriculture, said among many other good things: "You should keep your hog house just as clean as this room. After you feed them, clean the feeding floor. What would you think of your wife if she let the dishes set on the table from one morning to another? Suppose the supper was served on the same dishes; you would say to yourself that you wish you had not married that woman. I would no more think of feeding my hogs on a feeding floor that had not been cleaned immediately after the last meal, than I would of eating my dinner from the breakfast dishes without washing. I have not done it in thirty years. It is a small matter." But then he too is an old timer and therefore no criterion or authority.

Hoping that we may be forgiven by all the up-to-date swine breeders for our many errors, we shall be content if they ascribe these errors not to the heart but to the head. THEO LOUIS.

Louisville, Wis.

Defends the Holstein Breed.

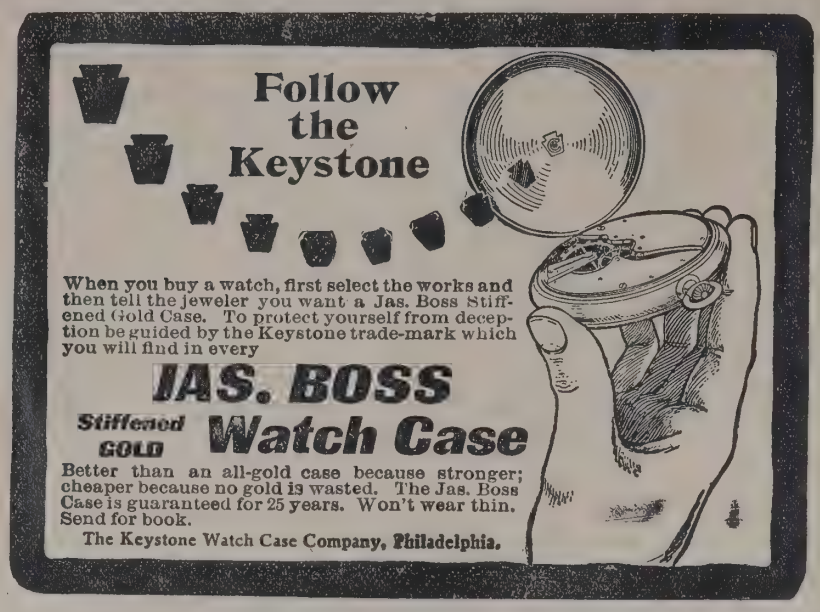
ED. HOARD'S DAIRYMAN:—It is a refreshing ebullition your correspondent, A. R. F. pours forth in the issue of Feb. 6th, under the guise of candid, unprejudiced advice on "Which Breed." The indulgent satisfaction with which he imperiously rules the most popular dairy breed in the country out of its class, to his own evident satisfaction—if not to that of all "unprejudiced" (?) people—is amusing to witness but a pitiable evidence of the writer's inability as a counsel. He has found "in his experience" and "can prove" that Holstein-Friesians rate down 5th in the list of breeds, and we read on anxiously for the facts of an experience so wide and accurate as to make such a complete demonstration of their miserable failure as a dairy breed. He assures Mrs. R. B. B. that a Holstein that will make 15 pounds of butter in a week will eat twice as much as a Jersey that makes 25 pounds. What becomes of all that vast amount of feed she has the capacity to eat? Does he rate them at the head of beef producers, or has he given it all a "through ticket."

We take down the last report of economical tests and the second cow in the index is a two-year-old heifer, tested under the supervision of the Minnesota Experiment Station, making a little over 15 pounds of butter 80 per cent fat, on a ration of 7½ pounds grain, 2 5-7 pounds of hay and 47½ pounds of beet pulp, containing about 1.425 pounds protein.

With this as a basis, A. R. F.'s wonderful cows would be making their 25 pounds butter a week on a ration of less than 1 pound of protein per day. We submit it was never thought of being done and we begin to suspect A. R. is writing show bills. We read on for the facts of his experience, but they are not there; instead, we find him trying to prove the superiority of his ideal cows by quoting from an alleged test in which it appears that the best cow made less than 270 pounds butter in a year, considerably below the requirements set by the DAIRYMAN for any cow.

If the experience of a majority of the dairymen in the dairy sections of New York, Wisconsin and Illinois is of any value it clearly points to the fact that the Holstein-Friesian is the most popular and profitable dairy cow for the rich soils of this great country. Come to think of it, we do not remember of ever having read of a Jersey cow being officially tested, by an absolutely disinterested party, that made 25 pounds of butter.

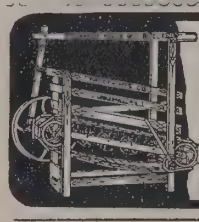
In conclusion, if Mrs. R. R. B. wants cows that will produce 40 to 80 pounds milk per day and 15 to 20 pounds butter per week, and are vigorous and hearty in any climate, and produce calves like themselves, that will come up to their feed three times a day without coaxing, the Holstein-Friesian will meet her expectations. G. W. MCKAY.



Iowa.

Alfalfa on Land that Will Produce Beets Without Irrigation.

A California reader wants to know whether alfalfa will grow on land where beets will grow without irrigation, with no rain from May to October, except occasional showers.



The better way to decide this question is to try alfalfa in a small way and thus ascertain definitely as to what could be depended on. While alfalfa is especially adapted for semi-arid regions, it flourishes best where irrigation can be depended on. It is, however, a plant of very deep root and will draw its sustenance from the very lowest depths in the soil. Commence with a small acreage, two or three acres at most. That is the way we are doing in Wisconsin, and by experience are learning just what kind of soil and attention the alfalfa plant needs in this climate.

This inquirer also asks whether it is better to feed middlings, bran and oil cake wet or dry. This is perhaps an open question, and practice among good farmers varies. For ourselves we prefer to feed these articles without wetting, but whenever practicable would mix them with silage.

Corn and Cow Pea Ensilage.

ED. HOARD'S DAIRYMAN:—In your issue of Feb. 6th was published a letter of mine, in which I mention the value to me this winter of my mixed corn and pea silage, as a home grown protein food for the dairy cow.

I have received more than a dozen letters, from almost as many states, written by dairymen inquiring for further particulars as to the planting, cultivating and harvesting this mixed silage.

One fact is settled in my mind by this incident viz: That HOARD'S DAIRYMAN is read over a wide extent of territory by men who aim to profit by what they read. The DAIRYMAN is not read for mere pastime; the questions asked and inquiries made show that they mean business.

I have not had time to give satisfactory answers to all these letters personally, so I ask permission to answer through the DAIRYMAN.

I will try to give a plain description of my practice, knowing, however, that it cannot fit all sections alike. I usually break a field of wheat, rye or clover stubble as soon as possible after harvesting the grain or hay, roll and harrow to get a good firm seed bed, and plant the corn and peas together in this way: use a two-horse corn planter; put corn in one box and peas in the other; drive across the field; planting corn in one row, peas in the other; turn and drive back in the same track, this plants peas in corn row, and corn in the pea row; and so on over the field.

The land being usually dry at this season, this double pressure on the grain almost insures a good stand of both corn and peas. I use plates that drop one grain of corn every 12 to 14 inches, and two or three peas every 8 or 10 inches. This requires about one gallon of corn and two gallons of peas per acre; the ground is usually warm at this season, and the young plants show very quickly. As soon as well up all over the field, run over with Hallock weeder, going with the rows; in about three days go over the field again with weeder, going across the rows.

When the corn is about six inches high, plow out thoroughly as as deep as I can go, with small points on the cultivator or double shovel, and never use the plow again, unless there is a very hard rain soon after the first plowing. After this, cultivate once a week with the weeder until corn is too tall, then use the 14-tooth Iron-Age 1-horse harrow; keep the land level. Cultivate shallow and frequent, so as to keep a lose dust mulch on the surface. Continue the cultivation until silks show plentifully over the field; by this time the peas will begin to spread and cover the row so they will help retain the moisture. I have never failed to get a fair crop in this way, even in the dryest seasons. No roots are ever broken or exposed to the hot sun; the loose dust on the surface prevents evaporation, there is always moisture found just below it, in easy reach of the little feeding roots, and the dryer the season the more benefit is shown by this shallow, level, surface cultivation. I prefer a variety of corn that will make a fairly tall stalk and several small, well-filled ears rather than one larger ear.

The Whippoorwill pea does not make as much vine as some other varieties, but bears more grain than any other. To make the best of silage I want all the grain in it that I can grow, both corn and peas. This pea will begin ripening in about 90 days, but will hold the ripe pods and keeps on forming new ones for about 120 days. Knowing this we can plant a variety of corn that will be ready for the silo at the same time, just when the pea is at its best. I want the corn well glazed, too hard for table use, when put in the silo. A half-grown, immature corn crop makes a wet, sour silage, a little better than the refuse from a vinegar factory, but I do not want it for my cows.

The ideal silage crop is a corn with fairly tall stalk, well filled with small mature ears, and the pea vines loaded with long ripe and half ripe pods. Cut this crop with the corn harvester, there is no loss; all is gathered up in bundles convenient to handle. There is nothing left but a short stub with the root.

My silos are round, stave structures, holding 33 tons each. I prefer two small silos to one large one holding the same. I finished feeding out my first one Feb. 10th; fed 10 cows and the bull just 100 days, in all eleven hundred days' feed. The work of filling that silo, that is the cutting with the harvester, hauling to the cutter, cutting and packing in the silo, cost $11.50. This is about one cent per day's feed. Then any farmer can figure what it costs him to grow the crop. It cost me last year forty-six cents per ton to grow the crop. I use a Tornado cutter, run by a horse power overhead gear—the cutter sets on a floor overhead the horse power so that less length of elevator and less power is required to fill silos. The wagons are unloaded on a platform on a level with the cutter, by lifting the bundles up from the wagon instead of throwing them down on the ground.

When silos are filled, I cover with any kind of trash that I may have. Wet this thoroughly and lay some loose boards on top, to help hold the moisture, until the covering rots and forms a solid, air-tight covering. When opening to begin using the silage, throw off this rotten mass, and always feed from the top and there is no loss of good silage.

I have used my silos nine years; have used the mixed corn and pea silage four years—first two years, planted the crops separate, cutting the peas with mower and corn by hand, hauling separately and mixing at the cutter. The use of the corn harvester gives a more even mixture and costs less to handle the crop.

Darks Mill, Tenn. J. N. M.

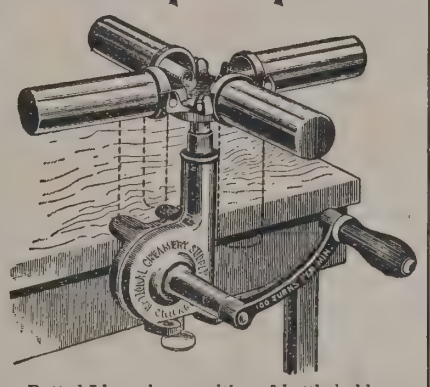
May

There is a best time for doing everything—that is, a time when a thing can be done to the best advantage, most easily and most effectively. Now is the best time for purifying your blood. Why? Because your system is now trying to purify it—you know this by the pimples and other eruptions that have come on your face and body.



Hood's Sarsaparilla and Pills

Are the medicines to take—they do the work thoroughly and agreeably.

Accept no substitute.

NATIONAL

Babcock Milk Tester

Dotted Lines show position of bottle holders when not in motion.

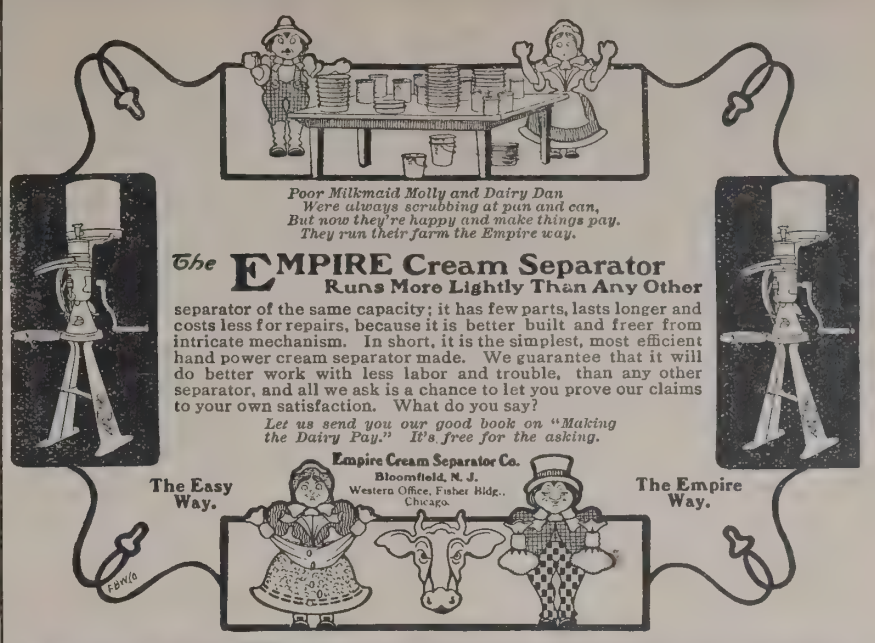
Has enclosed cut gears.
Swinging bottle-holders.
Runs without jar.
As well made as a cream separator.
Best tester for dairymen ever made.

The weight of machine when boxed, approximately 11 lbs.

DOES YOUR DAIRY PAY?

It costs no more to feed a profitable than an unprofitable cow.

NET PRICES:



No. 1,—2 bottle, complete for testing milk.... each $4 00
No. 2,—4 bottle, complete for testing milk.... each 5 00
No. 3,—2 bottle, complete for testing cream and milk, each 4 50
No. 4,—4 bottle, complete for testing cream and milk, each 5 50

Prices include full directions for making test, bottle of acid, test bottle brush, acid measure, pipette and test bottles.

We are the great Dairy Supply House of the West. We carry an immense stock of all kinds of Butter and Cheese Making Apparatus and Supplies. Write for catalogues and circulars.

National Creamery Supply Co.,

450-458 Illinois St., CHICAGO, U. S. A.

Poor Milkmaid Molly and Dairy Dan
Were always scrubbing at pun and can,
But now they're happy and make things pay.
They run their farm the Empire way.

The EMPIRE Cream Separator
Runs More Lightly Than Any Other

separator of the same capacity; it has few parts, lasts longer and costs less for repairs, because it is better built and freer from intricate mechanism. In short, it is the simplest, most efficient hand power cream separator made. We guarantee that it will do better work with less labor and trouble, than any other separator, and all we ask is a chance to let you prove our claims to your own satisfaction. What do you say?

Let us send you our good book on "Making the Dairy Pay." It's free for the asking.

THE MILK CANS TO BUY.

You do not need to be told that there is a vast difference in milk cans. You can make no possible mistake if you select any one of our universally approved **Iowa, Elgin, Chicago, Burn, Omaha** or **Wisconsin** patterns. Made of steel with strong protecting bands, they are the best guarded against denting, and their loaded or soldered inside seams, with heavy tinning and retinning, make them easy to clean and leave no chance for rust to start. In the superior shapes of their non-pull-off handles, they are not approached by any other make. Ours is

A CREAMERY SUPPLY HOUSE

not connected with any trust. In addition to a general line of creamery machinery and milk dealer's supplies, we manufacture such specialties as the **Dairy Queen Churn, Boyd Cream Ripener, Cream and Milk Vats, etc.** If you wish to build a combined butter factory on the co-operative and separator system, write us, and we will send a competent man to organize the company for you. We equip them on strictly sanitary lines, for which our improved appliances are noted. We publish a special appropriate catalog for every specialty and for every branch of our business. Write us for anything in the creamery supply line and we will mail free the proper catalogue.

STURGES & BURN MFG. COMPANY,
Kansas City, Mo. Chicago, Ill. St. Paul, Minn.

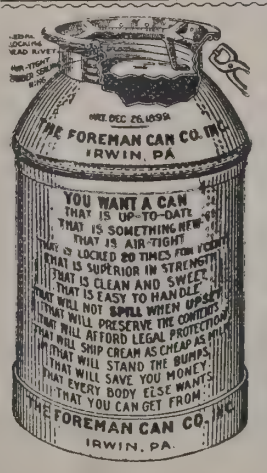
DO YOU Need a Friend?

We carry them in stock and can ship you one on short notice.

OUR IDEAL BOTTLE FILLER

Is made in two sizes, filling two or four jars at once. Just the thing for small and medium sized dairies and milk plants. We carry a complete line of Bottle Fillers, both large and small, and can meet the needs of every one.

Our Milk Dealers' Price List tells all about them, and is yours for the asking. We carry at all times a complete line of **Milk Dealers' Supplies,** and make prompt shipments. Try us.



Pasteurizing Apparatus, Low Down Milk Wagons, Ice Cream Supplies and Apparatus, Milk and Cream Signs, Milk Jars, etc., etc.

WILL IT PAY YOU TO TAKE HOARD'S DAIRYMAN?

W. H. Jenkins took a census in 1901 of 50 farmers who were patrons of the creamery in Montrose, Pa. Twenty-five of them read dairy papers; twenty-five did not. The twenty-five who did read dairy papers averaged $50.23 per cow for the year. The twenty-five who did not read averaged $32.95. Here is a difference of $17.28 per cow. Did it pay the twenty-five to read? Did it pay the other twenty-five not to read? That's not all. Those who did read averaged a profit over cost of food of $15.06 per cow. Those who did not read averaged a profit of 66 cents. Is not that dairy farmer standing greatly in his own light who will not pay 2 cents a week for Hoard's Dairyman? These are hard facts worth thinking over.

We are receiving of late a good many requests for a bundle of copies of HOARD'S DAIRYMAN for distribution. We are very glad to forward copies for distribution, for we need the help of every reader to increase the circulation of the DAIRYMAN. Get up a club of subscribers among your neighbors. If there is going to be a meeting of the creamery or cheese factory patrons, write us for a bundle of sample copies for distribution. If you are going to a farmers' institute, have some copies with you. These meetings afford excellent opportunity to work up a good club. Write us at least a week ahead of the meeting saying how many copies you want and we will promptly forward. Give us your help.

COLORING BUTTER.

The conflict of opposing sentiment which was caused by Maj. Alvord's remarks at the National Creamery Buttermakers' Convention, in which he charged that the coloring of butter as well as oleomargarine is a fraud, has served the excellent purpose of bringing out some very well considered opinions.

With this, as with all other questions of a mixed ethical and commercial character "circumstances alter cases."

The arising of a stupendous and pronounced fraud called oleomargarine and the enactment of state and national laws against it, all, or nearly all, based on the color proposition, puts the coloring of butter on different ground from what it ever occupied before. Here comes a powerfully organized swindle, with the great meat packing trust behind it, threatening serious injury to one of the greatest of our agricultural industries.

This swindle worked its way through imitating the natural and usual color of butter to the extent that fully 90 per cent of it was consumed by the eater, under the supposition that it was cow butter. That imposition was made possible in the main by stealing the yellow color of butter.

The dairymen attack this fraud at that vital point. They secure laws in thirty-three states, prohibiting absolutely its sale in the yellow color of butter. They also secured the enactment of a Federal law, which taxes it 10 cents a pound when ever offered for sale artificially colored to resemble yellow butter. By all this legislation the legitimate color status of butter is established as being yellow. By the same legislation it is also established that oleomargarine, when colored yellow, is an illegitimate and deceptive substitute for butter.

Now, here we stand, the makers of honest butter, colored yellow or of natural yellow color, on one side by common consent. and on the other side the makers of a colored fraud and imitation of butter.

In the midst of this controversy Major Alvord, Chief of the Dairy Division at Washington, stands up and declares that the coloring of butter yellow is a fraud. He seemed to have more concern about coloring an honest product in its own natural color, than he did the coloring of a counterfeit, to take its place by deception.

Discuss the matter as we will, the instincts of the dairymen of the United States were aroused to the conviction that Major Alvord was giving "aid and comfort" to the enemy of all dairymen, whether he purposed so doing or not.

SORGHUM IN THE SILO.

A certain French writer says the superiority of the American people comes from their having a new country and consequently such a wide range of experience. This is a good thought. Now, take that thought and apply it to HOARD'S DAIRYMAN. What a wide range of experience it presents on this great dairy question. Men can see almost on all sides of it in a year's reading.

Many people have written us asking: "What about siloing sorghum?" We had no experience and could not say. But here comes F. M. Parsons of Des Moines Co., Iowa, and gives *Wallace's Farmer* a good bit of valuable experience on that point. By the way, there are several other valuable considerations brought out concerning the great economy of the silo in feeding either for meat or milk.

Mr. Parsons says:

After years of experience with ensilage as a feed for dairy cows and young stock, which impressed upon me the value of it, I strove to get enough of it to feed my herd through the summer as well as winter. In the spring of 1901 I hired pasture for my cows through the day, which enabled me to break up 20 acres of meadow pasture. Upon advice of our friend, "Buff Jersey," I put this 20 acres in sorghum, drilling the seed with a corn planter, dropping about 2 to 5 seed every 16 inches in the row.

We cultivated it with a "Tower" surface cultivator, and though the season was the driest known by the present generation, it yielded 16 to 18 tons of green feed per acre. There was scarcely a weed on it, and the surface of the ground was kept well pulverized, forming the best kind of a mulch to conserve the moisture. It was planted about May 28th, and got nicely started before the dry weather set in. During the severely dry and hot weather it grew but little, but after the fall showers began to come it grew very fast, until one could hide in it on horseback. We cut it with a corn harvester, doing the work nicely and putting it in nice shape to handle; and put it into the silos with the corn, alternate loads. That year we fed about 50 head, from July 1st to May 10th next spring, from about 55 acres, the corn crop being very poor.

This year, 1902, we put the sorghum ground into corn, which yielded up to 15 tons per acre; and another 20 acre piece into sorghum. This ground being rather flat and poorly drained the yield was no more per acre than the crop of the previous year. This crop was also put into the silos (except three acres).

From the 20 acres of sorghum and about 28 acres of corn we cut 650 tons of ensilage, and 60 loads of sorghum fodder. The ensilage alone will feed 75 head, at least, for a year (from 45 acres).

The top half of the sorghum was frosted before cut. It laid on the ground from one to three days, when it was hauled up and ricked near the barn. It has kept well and is eaten up pretty well by the young stock.

Some people advise sowing sorghum broadcast, but I think it better to drill it. First, because it requires less seed. Second, I believe the yield is greater. Third, one can cut it with a corn harvester, and handle it so much easier. Fourth, growing more rank and with more stalk, there is less liability of containing prussic acid, according to the Nebraska Experiment Station.

The feeding value of sorghum fodder I believe to be about equal to timothy hay; and in the silo, I consider it worth about three-quarters as much as corn. However, there is in sorghum several other advantages. First, if the season turns out dry, if properly cultivated, sorghum will make a big crop anyway. Second, for the silo, if the corn gets too dry before cut, the sorghum furnishes enough moisture to make it keep all right if mixed properly with it. Third, there is only about a week in which to cut up the corn, while sorghum will remain green and juicy all fall, and being so thick and juicy it requires a hard freeze to hurt it. However, for the silo, if your corn gets too dry, a certain amount of nutriment is lost, irrevocably, and the sorghum won't get it back. Every day your corn stands after the proper time to cut it, the more feeding value you are losing.

Sorghum furnishes the dairyman or farmer on high priced land, a splendid substitute for timothy for his horses, and the yield is so large it will pay him to grow it for this purpose, cure it in shock or rick, and run it through a cutter or shredder when it makes splendid feed. However, for cows or cattle, I much prefer corn in the silo.

A MAN BIGGER THAN HIS FARM.

There are two classes of farmers: (1) The man who is bigger every way, than his farm. To such a man it don't make much difference how many acres he has, he runs the farm on close practical business principles and makes a profit. (2) The man whose farm is bigger than he is. No matter how many or how few acres he has, he don't run the farm; the farm runs him.

E. P. Snyder gives an account in the *Ohio Farmer* of a dairyman living near Toledo, who kept 35 Jersey cows on 100 acres of land and has made them earn the past year $4,400 gross, from which he has a profit $2,200. He makes butter and sells it in Toledo at 25 cents in summer and 30 cents in winter. His cows, counting butter, skim milk and everything, earned him over $125 apiece. This is an extraordinary herd. This man has four silos and feeds ensilage the year around, besides buying large quantities of concentrated feeds. But the secret lies in the man himself. Such a man will have the best cow he can produce, to put his feed into.

THE ALFALFA PLANT.

To the greater number of farmers the alfalfa plant is an unknown quantity, therefore, it is proper that a short description of the plant be given. Alfalfa is a smooth, upright-branching, perennial plant, growing from one to three feet high. The leaves are three parted, each part being broadest above the middle, rounded in outline and slightly toothed near the end.

The three leaflets are nearly equal in size, but the leaves vary in size on different parts of the plants and on different plants. Each leaflet when full grown, is usually one inch long and one-third to one-fourth of an inch wide.

The flowers are purple or violet in color and resemble the pea bloom in some respects. Instead of being in a close, round head as in clover, they are in long, loose clusters, or racemes as they are called, and the flowers are scattered over the plant as shown in Fig. 1. The seeds are enclosed in a pod spirally twisted in two or more complete turns, and each pod contains several seeds.

The seeds are kidney shaped and are on an average 1-12×1-6 inch. They are one-half larger than red clover seeds, and vary from a yellow brown to a bright yellow like the yolk of an egg. A field of alfalfa has a dark green color until the flowers appear when it takes on a violet shade, succeeded by a light brown as the seed pods ripen.

VARIETIES.

Besides the well known cultivated variety, there are two others which, by some authorities, are considered as distinct species. These are the yellow or sand lucerne and the more widely known Turkestan alfalfa. The first one has not at present much agricultural value, although it is recommended for use on very light, sandy, limestone soils. It will not stand water as well as the common alfalfa, but will endure cold better.

The United States government has for several years been introducing an alfalfa found on the high table lands of central Asia, and which from the local conditions under which it was found seems to deserve a somewhat extended description. The inability of the common alfalfa to thus far withstand very low temperature, has doubtless prevented its wide introduction in the northwest states, but this failing seems to be wanting in the Turkestan variety. The Department of Agriculture at St. Petersburg describes the variety as follows: "The native lucerne would seem to be a cattle fodder that cannot be replaced in countries so dry and hot as Turkestan, and the Trans-Caspian province. Experiments have shown that the native alfalfa, particularly when there is a lack of water, is vastly superior to the common alfalfa, in the crop it yields, and that it is able to grow well with a minimum supply of water—a supply so small that the common alfalfa would perish from drouth.

This peculiarity of the native lucerne is to be explained by its manner of growth. It possesses a very large root system and its leaves are covered with a thick down, and this in connection with a deep-cut orifice on the leaf enables the plant on the one hand to imbibe the moisture from the deeper layers of the soil and on the other hand to exhale it in very small quantity.

Along the Volga river at the dry-region experiment stations of Eastern European Russia, the plant was found doing well, and also in the desert and semi-desert regions east of the Caspian sea where only camels can live and clouds of dust are so thick that a wet sponge was found essential for comfort in breathing. In these localities this plant is exposed to a severe dry cold in winter, and seems to be very hardy to both dry heat and cold.

LENGTH OF LIFE.

Alfalfa is a long-lived plant and in this respect has a decided advantage as a fodder plant over the clovers. How long it will continue to grow and supply forage, under proper conditions is an open question. Fields are known to be in good condition after 25 years of continuous cropping, and there are reports of fields in California and South America several times this age.

It is a plant that requires three and even four years to reach its prime in production, and is good from seven to ten years before a decline is shown, but the decline comes not so much from lessened vitality of the plant as from the crowding in of native grass and weeds that are quick to take advantage of any opening that may present itself. Like any other cultivated crop it must have care and attention to obtain the best results, and these supplied it will continue to give large returns. The fact that its root system is so large and deep growing has a decided effect on its duration of of growth. The root tendency is always down, and if through inability to pierce through a hard-pan near the surface they

are obliged to grow laterally, they either rapidly exhaust the sub-soil or are unable to obtain the necessary moisture, the result is soon seen in a stunted growth, if not the death of the plant. The alfalfa is also very susceptible to standing water, whether on the crown of the plant or in the soil where the roots have to grow in search of food. Land where the soil water is within a few feet of the surface is not fit for prolonged growth of alfalfa. For a few years the growth seems to be normal, but the after growth is disappointing and the result is a short-lived field of alfalfa.

If the proposed alfalfa field contains hollow places, where water is liable to stand in the spring, or during periods of heavy rain in summer, such places should have provision for draining, either by open ditch or tile; otherwise such places will soon show the effect of flooding, in the death of the plants. A flooded period, which would do no injury to other crops, is fatal to alfalfa. If covered with water for over 48 hours it dies. An overflow of less than 12 hours seldom does any damage other than washing. It will not grow in water soaked soil and in such places, or poorly drained soil, the roots will rot, with the death of the plant as a sequence.

The soil water should not, for best results, come nearer to the surface than 20 to 30 feet, although there are places

where the upper soil is well drained, that the soil water may come to within 12–15 feet of the surface, without bad results, but these are exceptions. Although it kills out when too much water is supplied, yet it must have some water as well as food, and for this reason it will not grow well when the subsoil is a loose gravel, containing neither water nor food, although it may do fairly well if there is a large body of good rich soil above the gravel.

SOIL.

It is very probable that much of the failure in establishing alfalfa in the states of the middle-west has been owing to the nature of the soil. The plant likes a warm climate with a moderate rainfall and a *deep alluvial soil containing lime.* The prairie soils of the middle west are very deep and rich, containing large quantities of humus, and are thus low in lime, with a tendency to become acid unless well drained; conditions that are sufficient to materially hinder the growth of alfalfa.

It prefers a light to a heavy soil and reaches its greatest perfection on the deep, alluvial, sandy loams of river and creek bottoms. Lime is very necessary to its growth, and on the other hand, iron is very detrimental, and it is useless to try to grow this plant in locations where iron ore is known to be present. A soil of decaying limestone, or soils containing marl cannot be improved for alfalfa, as it contains besides lime, potash, magnesia, phosphoric acid and sulphates.

If the ground water contains the above elements in quantity to supply enough food, alfalfa will grow in a soil composed almost entirely of sand, but the surface layer must contain enough food to give the young plants sufficient growth to enable them to reach the food supply below. Alfalfa does well near alkali sinks where other more delicate feeders would die from excess of alkali.

Although it is capable of obtaining its food from deep in the soil, when it is once established, the young plant is comparatively delicate and must get its first year's growth in a soil containing plenty of available plant food and the soil must have a thorough preparation to render the fertilizing material immediately available to the young plant. The soil must be made so fine that the particles can come in immediate contact with the seed and it must be firmed by rolling or planking, that the drying out of the soil and loss of moisture may be reduced to the minimum, that the young plant be not deprived of the necessary water required at this stage.

For the above reason, new broken soil is not well adapted for sowing to alfalfa. The soil cannot be mellowed and broken up sufficiently, and if a heavy sod is turned under, it may ferment sufficiently to make the land slightly acid for a year or so, a condition, which is very detrimental to the growth of the young plant, yet the same land after it has been cropped for two or three years, will do excellently.

The soil should be comparatively free from weeds, and to obtain this result, a cultivated crop should precede the alfalfa. Corn and potatoes are both good for this purpose. On stiff, hard land, millet is a good crop to mellow the soil, but it must be cut before the heads appear, else enough seed will mature and shell off to re-seed the land and if thus re-seeded it makes an exceedingly bad weed. It does not follow sorghum or kafir corn well, as both of these crops exhaust the water of the soil more than other forage crops and this must be considered in dry climates or seasons.

The best crops to precede alfalfa are the legumes, Canada field peas, soy beans, cow peas or clover. They put the land in good condition and supply nitrogen and humus in the form needed by the young alfalfa plant. But whatever crop precedes alfalfa, there is none the less necessity for careful preparation of the soil and the formation of a fine seed bed if good results are to be obtained.

For Fresh Jersey Cows.

Will you please form the cheapest balanced ration of the following feeds, for fresh Jersey cows weighing about 800 lbs., to give me the largest flow of milk? Late cut timothy hay, bran $20 per ton; corn meal, $21; oil meal, $26.50. Also, best grain to feed cows in summer, when pastures are short. O. B. W.
Conneautville, Pa.

Late cut timothy hay makes very poor feed. It is probably some better than saw dust, but it is mostly woody fiber and a large proportion of it wholly indigestible. It answers of course for filling and filling is important, but it does not furnish very much available nutriment. For this reason we suggest heavier grain feeding, and do not think that 6 lbs. of bran with 2 lbs. corn meal and 2 lbs. old process oil meal would be any too much. If the very largest flow of milk, without regard to cost, was desired even this amount might be considerably increased.

Bran and corn meal, equal parts by weight make a very satisfactory summer feed for cows on pasture.

Soiling Ten Cows.

I have six acres which have been pastured for two years now. I would like to know what to put in this field for soiling in place of pasture for 10 cows (poor, scrawny Jerseys, good only for 350 lbs. butter per year average). C. I. H.
Hunt, N. Y.

Where one wants to follow soiling throughout the entire season preparations should commence the year before. There should be some clover seeding, some winter rye sown and possibly other feeds. Under the present conditions, we would advise this inquirer to sow one acre of oats and peas—1½ bushels each of seed—just as early in the spring as the ground can be worked, and 10 or 15 days after that sow another half acre of oats and peas. About May 10 sow a half acre of millet, using 10 quarts of seed, and about the same time plant an acre of corn. About the last of May or the first of June plant another acre of corn and the first of July sow an acre of millet, or plant to corn, and the first of August sow an acre of barley and oats, using 1½ bushels of each for seed.

A New York Ration for Fresh Cows.

I have 18 cows due to freshen about March 1st, and weighing about 900 pounds. Have plenty good timothy hay and good, well eared ensilage; can get grain as follows: buckwheat middlings, $18 per ton; bran, $22 per ton; meal, $21 per ton; gluten feed, $26 per ton; cotton seed meal, $28 per ton. Please give me balanced ration. J. C. B.
Maples, N. Y.

After these cows freshen and the fever incident thereto, subsides, commence with a very moderate allowance of grain and gradually increase from day to day until the cows are receiving for full feed, a daily allowance as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates	Ether Extract
30 lbs. silage	7.92	.39	4.20	.21
10 lbs. hay	8.68	.28	4.34	.14
4 lbs. buckwheat middlings	3.49	.88	1.34	.22
4 lbs. bran	3.52	.50	1.54	.12
Totals	23.61	2.05	11.42	.69

Grass Mixtures for Maryland.

1 Which is best to use for hay and pasturage seeding, the ready mixed clover grass mixtures, or clover, timothy and red top, or one-third timothy and balance clover seed? By the clover-grass mixtures I have reference to that offered by seedsmen.

2 How frequently do up-to-date, practical dairymen remove the excrements etc., from their cow stables, even when absorbents are used?
Garrett Co., Md. J. B. M.

1 We always prefer to do our own mixing of feeds and seeds. Feed dealers and seed dealers do not make mixtures without expecting to gain some profit thereby. Clover, timothy and red top is a very satisfactory mixture both for hay and pasturage. (2) As a rule stables are cleaned only once a day.

A Vermont Ration.

Please formulate a ration out of the following feed stuffs; Bran from $23 to $24, per ton; cotton seed, $27 per ton; corn meal, $26 to $27 per ton; barley and oats, worth 50 cents per bushel and eight cents per hundred for grinding.

I have plenty of good corn silage and mixed hay, one-half clover, the corn meal, bran and cotton seed I shall have to buy, the rest I have.
Charlotte, Vt. L. W. T.

We consider barley and cotton seed meal the cheapest feeds named and hence suggest for trial as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates	Ether Extract
30 lbs. silage	7.92	.39	4.20	.21
10 lbs. hay	8.53	.48	3.96	.16
2 lbs. cotton seed meal	1.84	.74	.34	.17
4 lbs barley	3.56	.35	2.62	.06
Totals	21.85	1.96	11.12	.60

Oak Lumber for Silo

Am thinking of building a silo in my barn this year. Have plenty of timber both oak and pine. Would the oak be as good as the pine for building same? Would rather use oak if it would answer the purpose equally well. J. C. C.
Eagle Bridge, N. Y.

For the framing timber, oak would be better than pine, but for the lining which comes in contact with the silage, pine would be preferable, because less liable to warp and get out of place.

Black Noses for Jerseys—Heavy Bran—Pronunciation of "Protein."

1. I have a registered Jersey cow, which my neighbor says is not a full-blood, because she has a yellowish nose instead of a brown or black nose as all other Jerseys have. I hold that it is simply an indication of the former irregularity in color among Jerseys. Please state who is right.

2. I have some bran that is very heavy; no trouble in putting 80 lbs. in a sack. The lot before was very light; nothing but large, coarse hulls with no white specks among them. Please tell which is the more valuable for feed, and especially which contains the more protein.

3. How do you pronounce "protein?"
Oregon. M. S. S.

(1) The yellowish nose, although unusual among Jerseys, is no indication that this cow is not a full blooded Jersey. (2) We do not consider the heavy bran as valuable feed as the lighter bran. The lighter bran contains both more mineral matter and a higher percentage of protein. (3) "Protein is properly pronounced in three syllables, as it is spelled, but in practice the two last syllables are so closely run together as to make the sound very much as though spelled "teen."

Cow Peas for Silage.

I know you are tired of answering questions about silage, but I shall ask this one anyway. I have had experience with several silos, but they were all filled from land that had been prepared for years for that purpose. I haven't this kind of land. The average land here will make about 10 bushels per acre. Is there any way of determining the number of acres that will be required to raise corn enough to fill a silo 15 feet in diameter and 30 feet high?

I have seen somewhere an article on pea vine hay for silo. How is this hay suited for ensilage; also, when mixed with corn and amber corn?
Comer, Ga. SUBSCRIBER.

Answering inquiries is a part of our regular business, and if we did not have several questions before us for answer we should feel much as a merchant does when customers are few and far between.

Land that will not make more than ten bushels of corn per acre needs immediate attention. Sow cow peas, turn them under to get the soil in a more fertile condition. Carefully husband all the excrement from stock, both liquid as well as solid, and put it out upon the land. It is much more profitable to grow ten tons of corn on one acre properly fertilized and tilled than to work two or three acres and not get any larger returns. Cow peas make excellent silage and a mixture of cow peas and corn, or cow peas and sorghum, is also well adapted for silage in the southern states.

A Virginia Ration.

Please prescribe a ration for me that can meet the ends of utility as well as economy.

We have bran, at about $1.10 per 100 lbs.; middlings, at about $1.15 per 100 lbs.; corn meal at about $1.60 per 100 lbs.; cotton seed meal at about $1.75 per 100 lbs.; cotton seed hulls, at about $8.00 per ton; clover hay at abont $17.00 per ton; wheat straw at about $10.00.

I have all Jersey cows and want to produce butter in part, and also milk for the local trade.
Portsmouth, Va. C. B. M.

From the feeds named and the prices given we do not see how it would be possible to meet the demands of utility and economy more satisfactorily than to use a formula substantially as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates	Ether Extract
10 lbs. clover hay	8.47	.68	3.58	.17
10 " C. S. hulls	8.89	.03	3.31	.17
2 " C. S. meal	1.84	.74	.34	.17
4 " bran	3.52	.50	1.54	12
Totals	22.72	1.95	8.77	.63

Unprofitable Feeding.

I have 30 cows, part grade Holsteins and rest mixed native cows. Am milking 12 cows now, part fresh in December, and the rest were fall cows; rest will be fresh soon. Am getting 140 quarts per day: am feeding 2 lbs. of hominy meal, 2 lbs. corn meal, 4 lbs. of wheat feed; 1 lb. of cotton seed meal, per feed twice a day. Please make me a formula or balanced ration, out of the kinds of feed mentioned below. Hominy meal, $25 per ton; corn meal, $23; gluten meal, $28; wheat feed, $22; oil meal, $31; cotton seed, $31. Have no roughage but mixed hay, clover, timothy, and native grass and weeds. Have warm barn and warm water for stock, and water twice a day.
Heart Lake, Pa. C. E. M.

When cows are being forced for a large test it may be all right to feed them 18 lbs. of grain per day, but for regular feeding we do not think it profitable to feed more than about half that amount. The larger feed will probably produce a larger yield, but the increase in the yield is out of all proportion to the increase in cost. For example, the daily grain allowance of these cows is costing 21.7 cents and they are yielding about 25 pounds of milk per day. With the value of the hay added the feed cost of this milk is considerably more than a cent a pound. We are of the opinion that the hominy meal and the corn meal might be gradually withdrawn and possibly 2 lbs. of the wheat feed. We would not advise doing this at once, but gradually, taking three or four weeks to make the full reduction, noting results and being governed thereby.

Will it Pay to Build a Barn and Silo?

I am living on my father's farm of 160 acres; can live here as long as he lives and probably longer if I desire. I started in the dairy business last fall; have 14 full blood Jerseys, separator, gasoline engine to run it, churn, pump water, etc. Also ice house, fixed first-class in dairy room; get 25 cents per lb., cash for all the butter we can make, four miles to town. I have good clover hay and ground feed for my cows, but they take all of the weather, (now they are out in a blizzard). Now, would it be prudent and wise for me to put up a silo and good barn for them this spring? I want to make my cows pay, and I know they are not doing it now. We have a good market, now we want to get the butter. C. H. S.
Girard, Ill.

A barn and silo for such a farm and herd as described above, would cost not less than $1,000, and probably not more than $1,200. Either sum is more than we feel at liberty to advise any one to expend on a farm where his tenure is uncertain and indefinite. Very likely, however, some arrangements might be made whereby he could be reimbursed in whole or in part for this expenditure when the farm passes into other hands. If this could be done we do not hesitate to advise building the barn and silo, and to this end we renew the advice given to an Ohio inquirer who asks about a barn for a hundred cows, to get a copy of Prof. King's book entitled *Physics of Agriculture*. This book not only contains very helpful suggestions in regard to building barns and stables, but it is crowded from cover to cover with valuable information on many other subjects that continually confront the inquiring and progressive farmer.

Sex in Breeding.

Some bulls get nearly all heifers and some the reverse. Which is the best to breed from for dairy purposes, or is there no choice, and does the sire influence the sex in any way? Is there any way to influence the sex in breeding? H. E. G.
Andover, Mass.

There are some matters concerning which nature is profoundly reticent, and the questions submitted by our inquirer are in this class. Not very long ago an Austrian physician thought he had solved the secret of nature's methods in determing sex, but he obtained but limited credence. The Czar of Russia and all his subjects are desperately anxious that a male heir may be born to inherit the crown, and it is safe to say that if there was any means for influencing sex, they would have been employed.

Rye for Silage.

We are having our first winter's experience in feeding ensilage, and are very much pleased with it. We have some rye growing which was intended for early pasture and then turn to corn for ensilage. Pasture is going to be very short; how would it do to let the rye head and put it in silo to feed when pasture is short? It is bottom land and could still put it in corn for ensilage. C. C. B.
Frederick, Md

There have been a good many failures in attempting to ensilo hollow stemmed varieties of forage. For ourselves we should not attempt to put this rye in the silo, but would prefer to turn it under as soon as it becomes too high for grazing and plant it to some crop for soiling purposes, sowing a limited amount at a time.

Milkers for 100 Cows.

I want to ask you how the dairymen or farmers manage, who milk 100 cows or more. Do they have milkers who milk 25 cows each, or do they allow 12 or 15 cows to each milker, and also give the milkers work on the farm between milkings? Any information you can give me will be thankfully received, and I would also like to hear from dairymen who have many cows, for instance, Mr. Daggett, Supt. of the McGeoch farms at Lake Mills, Wis. MAX.
Madison, Wis.

There are very few farmers in Wisconsin who milk 100 cows or more, and none, so far as we know, who do not expect the milkers to do more or less work upon the farm between milkings. Our own opinion is, that it is not advisable to expect a man to do good work when milking more than about 12 cows night and morning. It is but a short trip from Madison to Lake Mills, and it would be a very excellent plan for "Max" to visit the McGeoch farm and see for himself how matters are managed there.

A Vermont Ration.

Please formulate a ration for grade Durham and Jersey cows fresh from Aug. '02 to Feb. '03 out of the following: early cut mixed hay, good oat hay, mixed feed, $19 per ton; corn meal, $24 per ton; cotton seed meal, $28 per ton; and a limited amount of corn stover. C. F. McG.
East St. Johnbury, Vt.

Mixed feed is a very uncertain term. It may mean one thing in Vermont and quite another thing in New York or Wisconsin. A Vermont bulletin mentions a mixed wheat feed and gives it a value very closely resembling that of bran. Basing our figures upon this bulletin, we suggest as an average daily allowance, the following formula

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
10 lbs. mixed hay.....	8.53	.48	3.96	.16
10 lbs. oat hay.....	9.11	.43	4.64	.15
8 lbs. mixed feed.....	7.12	1.06	3.82	.24
Total.....	24.76	1.97	12.42	.55

Weight of Silage in Silo.

My silo, 38 feet high and 24 feet inside diameter, was filled ⅔ full of corn in medium condition last fall. It now contains 12 feet. What would be the weight of the first six feet and also the second six feet? What is the price of silage per ton this winter? E. P. S.
Sharon, Wis.

The top six feet will contain about 54 tons, the lower 6 feet 65 tons. The price will depend somewhat on the price of hay in your locality, but the average price will be about ⅓ that of timothy.

Swine.

Can you give us any information regarding a breed of swine known as O. I. C. breed? Would you advise purchasing this breed in preference to the thoroughbred Chester White, for breeding purposes? Would you advise raising thoroughbred Chester White pigs, or would it be more profitable to cross with the Berkshire? Which will be the most profitable feed to use for feeding pigs, white middlings, at $26.00 per ton; red middlings, at $23.00; shorts at $23.00 and ground oats a $20.00. Can either of these feeds be used at the above prices with buttermilk, for pigs, at a profite
N. H. KEENE.

It is with swine as with cattle, many men of many minds have different preferences, and as a rule those best informed are the least prepared to give expression to positive convictions. Our personal

'TIS A PITY

To Stay Sick, When a Postal Will Bring Help.

Please note this offer again.

Send no money—just a postal, stating which book you need.

I will mail you an order—good at any drug store—for six bottles Dr. Shoop's Restorative. You may take it a month on trial. If it succeeds, the cost is $5.50. If it fails I will pay the druggist myself—and your mere word shall decide it.

Just think what that means.

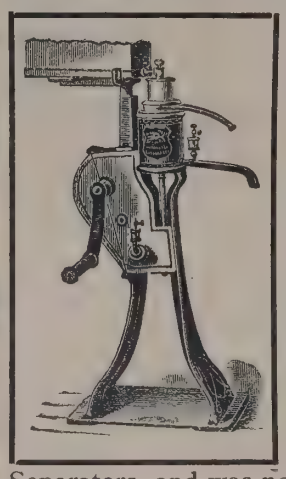
It proves that I have faith in the remedy, and faith in the honesty of people. It shows that I have learned how to cure these diseases, else the offer would ruin me.

Let me convince you. You are waiting when you should be well. When the test is made, I don't want a penny, unless you are glad to pay.

My success comes from strengthening the inside nerves, which operate the vital organs. I have spent my life in learning how to do it. A weak organ means a weak nerve power. It is like a weak engine that needs more steam. To doctor the organ is useless; what it needs is power to act. My Restorative alone brings back that power, and in most of these diseases no other way can cure.

My book will tell you why.

Simply state which book you want, and address Dr. Shoop, Box 934, Racine, Wis.



Book No. 1 on Dyspepsia.
Book No. 2 on the Heart.
Book No. 3 on the Kidneys.
Book No. 4 for Women.
Book No. 5 for Men (sealed)
Book No. 6 on Rheumatism.

Mild cases, not chronic, are often cured by one or two bottles. At all druggists.

The Champion Buttermaker

OF ALL THE ANNUAL WINTER CONVENTIONS

USES U. S. SEPARATORS.

At the Annual Meeting of the Vermont Dairymen's Association, at Rutland, January 6–8, 1903, there were 150 entries of butter, and that of Mr. J. F. McLam, Supt. of the Green Mountain Creamery, West Topsham, received the highest score

98½ POINTS,

and won

GRAND SWEEPSTAKES
AND GOLD MEDAL.

This butter was made from cream separated by creamery size U. S. Separators, and was not only the highest score at this convention, but so far this season is the

experience with swine is more limited than it is with cows, and if we are unable to say, as we are, that any one breed of cows combines all the excellencies, still less are we prepared to say that one breed of swine is to be preferred to all others, or to any other. The Ohio Improved Chester White (O. I. C.) has given very great satisfaction to those who have tried this breed, but the same is true of the original Chester White, of the Poland China and of the Berkshire. We do not think it expedient, except for experimental purposes, to mix or cross breeds.

"Red middlings" is a new term to us and what, if anything, distinguishes it from white middlings we are unable to say, unless it be that the red middlings contain more of the re-ground bran and are in effect shorts. Whether it would be profitable to feed any of the grains above named, at the prices given, in connection with buttermilk will depend altogether upon the price that could be realized for the pigs when ready for market. With good care it is not unreasonable to expect that, commencing with pigs weighing about 50 pounds, 100 pounds of gain could be secured from 125 to 150 of white middlings and 600 to 1,000 pounds of buttermilk.

A California Ration.

Please make me a ration for my nine fresh cows of the following feeds:

Bran, $18.00 per ton; wheat middlings, $23.00; rolled barley, $25.00; oilcake meal, $30.00; cocoanut cake, $21.00.

At present I am feeding 4 lbs. of bran, 4lbs. of cocoanut cake, and all the barley straw they will eat.

I have about ten tons of barley hay that I will commence feeding now, and plenty of barley straw. I also have about 50 tons of beet pulp.

Please let me know if bean straw is good for milk cows as I can get lots of it in the fall for almost nothing; also please let me know which is best for milk cows, barley hay or oat hay, as I can raise either kind?

I fed some bean straw last December and the cows seemed to do well, bowels were in fine condition, but got bad when I commenced feeding barley straw. P. S. F.

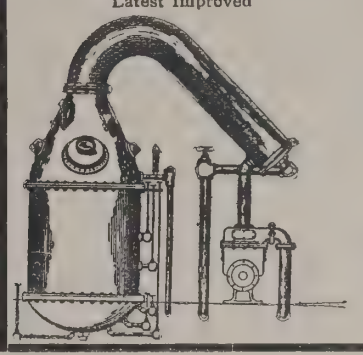
Castroville, Cal.

We would not like to go on record as expressing an opinion that barley straw formed a satisfactory roughage for milch cows, and in that connection we beg to refer to the editorial on page 30, under the title "A Penny Saved is two Pennies Earned." It does not pay as a rule to try to cheat the dairy cow. We are very glad therefore that our correspondent is now situated so that he can do better by his cows than he has been doing in the past. We suggest that he try the following combination as an average daily allowance for his cows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
30 lbs. beet pulp.....	3.06	.18	2.19	
10 " barley hay.....	8.52	.57	4.66	.15
8 " " straw	6.86	.06	3.29	.05
4 " bran.....	3.52	.50	1.54	.12
4 " cocoanut meal...	3.59	.62	1.53	.42
Total.....	25.55	1.93	13.21	.74

There is no satisfactory analysis that we are able to find of bean straw. Others, like our California correspondent, have reported to us that they have found it a very satisfactory source for a part of the roughage.

There is but little difference in feeding values of barley hay and oat hay, but according to the analyses what difference there is seems to favor the barley hay.



Which Breed of Cows for a Milkman?

ED. HOARD'S DAIRYMAN:—Please let me know through your columns which is the best dairy breed for a man who is shipping milk. I want a persistent milker and desire in course of time to get a thoroughbred herd. I have grade Jerseys and Guernseys and expect to purchase a thoroughbred sire to head my herd and are inclined to purchase a Jersey. From inquiries among the dairymen of my neighborhood, I learn they are in favor of the Jerseys, although they produce a smaller quantity of milk at a milking than some of the heavier milking breeds, but seem to be more persistent milkers. I like the Jerseys, but am in a quandary as to which is the best for my business. I am a young man just starting and wish to begin right. I have nice stables, well lighted and ventilated and expect to keep a record of each cow beginning the first of March. WALTER FAWCETT

Montgomery Co., Md.

If this young man can get a Jersey bull whose dam has a record of giving from 8,000 to 10,000 pounds of milk a year, he will make no mistake in selecting a Jersey. Persistence in milking is perhaps more a matter of training than of breeding. If he cannot find a Jersey bull of the character above described he might try an Ayrshire or a Holstein. The Ayrshire cross with Jerseys and Guernseys has produced some excellent cows giving quite large quantities of milk of very satisfactory quality.

Abortion.

ED. HOARD'S DAIRYMAN:—I enclose copy of list of questions sent around to farmers, last spring, and invite editorial criticism. It was too late in the season to get many responses, and I was too busy with work on the farm to answer all who expected a reply. I will soon send for publication the new ideas I have gathered from farmers who have been troubled with abortion and renew my former offer to send, free of charge, a list of questions to all applicants.

Those desiring my own experience with the disease and my list of six different causes of the trouble in my own herd, can have it by sending $1 to HOARD'S DAIRYMAN, which will pay a year's subscription for a new subscriber and for a copy of the book "Thirty Years Among Cows." Simply say to an enterprising neighbor that a book is offered as a premium for a new subscriber, and he can have the first reading of the book. That will show him you are at work for his welfare as well as your own.

Oconomowoc, Wis. N. B. WHITE.

The following is the list of questions:

QUESTIONS FOR FARMERS TO ANSWER.—ABORTION.

1. Number of cows in herd?
2. How many aborted in 1898?
3. " " " " 1899?
4. " " " " 1900?
5. " " " " 1901?
6. " " " " 1902?
7. Have your cows been near an aborting herd?
8. Have you taken your cows to a bull used in an aborting herd?
9. What remedy have you used?
10. With what success?
11. Are cases of abortion more frequent in your township than five years ago?
12. Are they less frequent?
13. Do you salt your hay?
14. Do you mix salt with any of your feed?
15. How much do you give each cow in feed daily?
16. If you do not mix salt with feed, how often do you give salt to cows?
17. Have you ever kept large pieces of rock salt where your cows can always have access to it?
18. Have you ever fed hay that came from salt marshes?
19. Do you feed grain in summer?
20. How much daily and what kind?
21. What has been your grain feed in winter?
22. How much gluten feed daily?
23. " " oil meal daily?
24. " " cotton seed meal daily?
25. " of different kinds of grain?
26. Do you feed well eared corn in fall?
27. Do you use a silo?
28. About how many bushels of ears per acre on your best ensilage corn?
29. How much ensilage do you feed each cow daily?
30. Have you ever ground rye for your cows?
31. Have you ever noticed ergot in rye?
32. Do you feed carrots or other roots and what kinds?
35. Do you use a dog to drive cows?
36. How many inches deep is drop in your barn?
37. How wide is your stable door?
38. Have you bought a bull used in another herd?
39. Have your neighbors' cows served by your bull, aborted?
40. Have cows had a chance to smell blood?
41. Do more heifers than old cows abort?
42. How soon after aborting do you breed your cows?
43. Have you had trouble in getting them with calf?
44. Have you ever noticed white discharges from the uterus several weeks before aborting?
45. Do cows sometimes run in an icy yard?
46. Have you a vicious cow, always trying to corner another cow?
47. Have you ever noticed her putting her horns under the belly of another cow near the bag?
48. Have cows been frightened by gunners and dogs?
49. Have they been frightened any other way?
50. Do cows sometimes bloat?
51. When cows come home full of grass, do you immediately feed grain?
52. In summer, do cows have a chance to drink at noon?
53. Did your cows or heifers ever abort while running on a marsh with coarse grass?

Please answer questions and return to N. B. White, Oconomowoc, Wis. A two-cent stams will be required for return. Sign your own name, post office and state.

Our Special Elgin Letter.

ED. HOARD'S DAIRYMAN—Butter advanced a half cent on the Elgin Board of Trade to-day. There were no offerings and consequently no sales were recorded. The price was made firm at 27½ cents by the Quotation Committee.

The sales for the week were 508,000 pounds.

Former markets were as follows:

Feb. 23, '03, no sales; price, 27 cents.
Mar. 3, '02, 41 tubs sold at 27 cents.
Mar. 4 '01, no sales; price, 22½ cents.
Mar. 5, '00, 30 tubs sold at 24½ cents.

Elgin, Ill., March 2. H. C. B.

How Near a Balanced Ration, Etc.

I have three full bred Jerseys, one half-bred Short-horn and Jersey; two Jerseys were fresh in May, 1902, one fresh in September, 1902; grade cow not fresh since September, 1901. I feed each cow 8 lbs. of bran and gluten meal, half and half, and 2 lbs. of oil meal and 3 bushels of cut corn fodder and a bunch of clover hay each day. From these four cows we are making 20 lbs. of butter a week.

How near have we a balanced ration?

Do you think a hand cream separator will pay, and what kind would you advise? J. A. L.

Belle Vernon, Pa.

We think this inquirer is feeding an unnecessarily liberal ration, especially when it is considered that these cows are already in an advanced stage of lactation. Of course they are doing very well under the circumstances, and he himself must be the judge as to whether they are making a profitoble return for their feed. We suggest that he try decreasing gradually the amount of bran and gluten meal and note the results. If there is not a considerable shrinkage in milk it may be profitable to feed, perhaps, not more than half as much.

It is extremely doubtful whether a hand separator used with only four cows would be a profitable investment.

CONCERNING OUR ADVERTISERS.

AN IMMENSE PLANT.

The following figures give some idea of the magnitude of the great Deering Harvester Works at Chicago: Works cover 85 acres of ground and 10,000 horse power is used in operating the plant, the consumption of coal being 500 tons daily. 10,000 people are employed by the Deering Division. 25,000,000 feet of hardwood lumber and 20,000,000 feet of pine lumber were used in 1902. 105,000 tons of steel and 90,000 tons of pig iron were used in 1902. 2,000 gallons of oil for paint and 10 000 pounds of dry paint are used daily. 30,000 miles of binder twine are made daily.

Farmer Brighton of Fairfield, Iowa, is just entering upon a new advertising campaign in this paper. It is apparent that in his combination tool—the Swine V to prevent hogs from rooting, cattle dehorner and stock marker—he has something which other farmers want. It is just a little ad. headed "No Humbug," and accompanied by a cut showing the tool and a hog's snout operated upon to show how it works. Look up this ad. if you keep hogs or have occasion to mark or dehorn.

DAIRY MARKETS.

ELGIN, Ill., March 2—Butter—There were no offerings and sales of butter on the board of trade to-day. The Quotation Committee declared the market firm at 27½c, an advance of ½c. Output of the week was 500,800 lbs.

"ADVERTISEMENT"

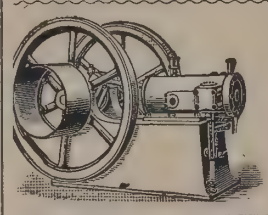
LIKE A DERRICK.

Pure Food Lifts the Sick Up.

Only those who have experienced the delicious feeling of returning health and vigor can properly appreciate the value of pure food. When the improper food is left off and scientific food such as Grape-Nuts is used in its place one begins to feel the glow of returning health. It feels as though some powerful derrick was lifting one up into the realms of sunshine once more.

"Some time ago I was taken sick and got so very low that I thought at times I would never be able to get out again," writes a business man of Wilmington, Del. "One day my wife saw an article in the paper about Grape-Nuts and read it to me. I was so impressed that I asked her to get some. How thankful I am that I did so. I was at that time reduced to a shadow of 75 pounds but the first week's use of Grape-Nuts brought me to my feet so that I could stand alone. By the second week I could walk out, to the great surprise of all, and now I can get out to my business without any trouble and I have made the phenominal gain up to 160 pounds.

"Improper food nearly killed me but when I left it off and used Grape-Nuts it did not take long to put me back in health. Name furnished by Postum Co., Battle Creek, Mich.

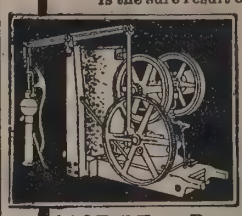


"Feed right, feel right" is a true axiom. Remember Grape-Nuts food is for Athletes, as well as the sick.

GASOLINE ENGINES

as power for the dairy have passed the experimental stage. Many dairymen now have them and all eventually must have them. The only questions to decide are the amount of power needed, and the most desirable make. With twenty-seven years of experience behind us, and a plant that has grown from 50 engines a year to 1500 a year capacity, we feel that we are equipped to build the best. There are other reasons why the "OTTO" is superior. We will tell them in this space from time to time. If in the meantime you need power, write us, mentioning this paper

THE OTTO GAS ENGINE WORKS, Philadelphia, Pa.



THOMPSON-LEWIS GASOLINE ENGINES

furnish the greatest possible power at the lowest possible cost in time, labor, fuel and money. They are so simple that anybody can run them without expert training or experience. Our Volume Governor gives uniform speed. Our Acme Mixer is the most positive and economical on the market. Our Hand Starting Lever starts engine with least effort. All bearings of Phosphor Bronze. Best material and workmanship throughout. Many sizes from 4 (actual) h. p. up. Best for all farm work—cutting and grinding feed, sawing wood, pumping water, separating cream, churning, etc. Send for our free catalog before you buy. It may save you time, money and annoyance.

J. THOMPSON & SONS MFG. CO., 113 BRIDGE ST., BELOIT, WIS

A Steady Water Supply

is the sure result of the use of our

Webster "Handy Man" Gasoline Engine.

Walking beam pump jack attached. Fits any pump and suited to either deep or shallow wells. Best thing ever made for the purpose.

1 1-2 Full Horse Power. Pulley for belting to light machinery—grinding, separating cream, churning, spraying, irrigating, etc. Simple, safe, efficient. Fully guaranteed.

Catalog of Vertical and Horizontal Engines of all kinds. FREE.

WEBSTER MFG. CO., 1086 W. 15th St., Chicago, Ills.

DON'T BUY GASOLINE ENGINES UNTIL YOU HAVE INVESTIGATED "The Master Workman,"

a two-cylinder gasoline engine, superior to all one-cylinder engines. Costs less to buy and less to run. Quicker and easier started; has a wider sphere of usefulness. Has no vibration, can be mounted on any light wagon as a portable. Weighs less than one-half of one-cylinder engines. Give size of engine required. Please mention this paper. Send for catalogue. THE TEMPLE PUMP CO., ESTABLISHED 1853. Meagher and 15th St., CHICAGO.

If you want a..... Gasoline Engine

that will be always ready to start, safe, reliable convenient, economical and durable, buy a FULLER & JOHNSON Frost Proof. No bother with water nor expense of broken cylinder, no waiting for wind or weather. All sizes, stationary and portable. Send for descriptive catalogue to the manufacturers

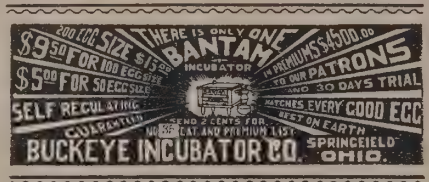
How To Make Money With Poultry and Incubators.



That is the title of our new 1903 book—196 large pages. It is far superior in every way to its predecessors. It embraces all that is best in poultry keeping, duck growing, broiler raising, egg farming and the production of winter chickens or roasters, drawn from the experience of the best experts in the country. It fully describes and illustrates the unequaled

CYPHERS INCUBATORS and Brooders,

which embody the greatest discovery of modern times in the field of successful incubation by artificial means. 250 illustrations show poultry plants that use Cyphers exclusively in the U. S., Canada, England, Germany, Holland, New Zealand and other foreign countries. Send 10c (merely to pay postage, as the book is free) for book No. 123. Circulars free.

Eggs—Receipts, 16,078 pkgs.; firm; state and Pennsylvania, average best, 17c; Western fancy, 16½c; southern, 16c; refrigerator, 8@13c.

BALTIMORE MARKET.

BALTIMORE, Feb. 26—Butter—The stormy and cold weather, throughout the entire dairy section, has not only caused a shrinkage in the make, but has had a damaging effect on the quality as well, consequently the receipts of strictly fancy stock are few and far between. All offerings of fresh, useful table grades are promptly taken at full values. Owing to the scarcity of fresh stock, there has been considerable inquiry for choice held creamery and several large lots have changed hands. Imitation creamery of desirable quality is in moderate supply and good demand, while defective stock is neglected entirely. Ladles—All arrivals of freah sweet solid boring stock meet quick sale. Rolls, although in moderate receipt, are not eagerly sought after, owing to their regular quality. Packing stock—The supply is equal to the requirements. All invoices of choice to fancy prints aud blocks meet quick sale. The market, at the close, presents a firm appearance, and still higher prices may prevail on all strictly fancy table grades.

Creamery Separator, extras, 28½@29c; firsts, 27@28c; seconds, 24@26c. June Creamery, extras, 25c; firsts, 23@24c; seconds, 20@22c; Imitation Creamery, extras, 20c; firsts, 18@19c; seconds, 15@17c, Iowa & N. W. Ladle, extras, —firsts, 18c; seconds, 15@17c. Ohio & Indiana Ladle, extras, — firsts, 17@18c; seconds, 15@16c. Roll, Ohio, extras, — firsts, 15c; seconds, 13c. Roll, W. Va., extras, — firsts, 14@15c; seconds, 13c. Ohio Store packed, extras, —; firsts, 14@15c; seconds, 13c. West Va. Store packed, extras, —; firsts, 14c; seconds, 12@13c. Creamery blocks (2-lb.) extras, 29@30c; firsts, 28c; seconds, 24@26c; Creamery prints (¼-lb), extras, 30c; firsts, 28@29c; seconds, 25@27c: Md. Va. & Penna. Prints, extras, 28@29c; firsts, 26@27c: seconds, 22@24c. Renovated butter, extras, 19@12c; firsts, 17@18c; seconds, 15@16c.

Eggs—The receipts of hen eggs, so far this week, have been liberal, and if the weather continues mild and open, we look for continued liberal receipts. Up to the present, the demand has been fully equal to the offerings. At the close there is little or no activity displayed, and the market is about steady at 14¼c. Duck eggs—There is a quick demand for all large clean stock, while small and dirty eggs are slighted.

Cheese—Offerings moderate; demand good; market firm on all choice to fancy stock.

N. Y. State—Cheddars, fine, 14¾@15c; choice, 14@14½c; fair, 13@13½c; Flats, fine, 14½@14¾c; choice, 13½@13¾c; fair, 12½@13c; Small, fine, 14¼@14½c; choice, 13½@14c: fair, 12½@13; Ohio Flats, fine, 13¼@13¾c; choice, 12¾@13c; fair, 12¼@12½c; O. Picnic, fine, 13¾@14c; choice, 13¼@13½c; fair, 12½@12¾c; Swiss Cheese, fine, 15c; choice, 12½@13½c; fair, 11@12c.

301 Exchange Place. G. M. LAMB & BRO.

NEW YORK MARKET.

NEW YORK, Jan. 28—Butter—Receipts for the week, 29,855 packages. Exports for the week, 2,642 packages.

Extra fresh butter sold quick on arrival at top quotations, is short and wanted at the close. The scarcity of this extreme top quality caused many buyers to take the next best; and firsts were in demand at 27@27½c with few sales at 28c. No fresh dairy here; fancy quality of new milchs makes would sell at 26@27c.

June creamery has been coming here in sample lots from all quarters, and buyers have been cautious, and took only the very finest for which they paid 23@24c; while parcels offered at 21@22½c were neglected. Exporters bought fresh ladles at 15@16c, and under grades of renovated at 12@14c. We quote:

Creamery, fresh, extra, 28c; medium, 25@27½c; poor, 18@24c; creamery, June, extra, 24@25c; medium, 21@23c; poor, 18@20c. Dairy, extra, 25@26c; medium, 20@23c; poor, 15@18c. Ladle, extra, 19@20c; medium, 15@17c; poor, 12@14c; renovated, extra, 20c: medium, 16@18c; poor, 12@14c.

Cheese—Receipts for the week—9,064 boxes. Exports for the week—4,063 boxes.

Small colored cheese have a light but steady demand from home trade and receivers report prices firm and full of confidence as to the future of the market. We quote:

Full cream, extra, 14@14¼c; medium, 13@13½c; poor, 11@12½c.

Eggs—Receipts for the week, 59 454 cases.

Supply was much lighter than last week, demand good and prices have ruled strong, with advancing iendencies at the close. Refrigerator stock is plentiful and sells at low and irregular prices. We quote:

New York & Pennsylvania, fancy fresh, per doz., 16½@17c; Northern & Western, fancy fresh, per doz 16@16½c; all sections, poor to good, per doz., 14@16c. Refrigerators, poor to good., 8@13c:

HARD FACTS
ABOUT CREAM SEPARATORS.

What the intending buyer of a cream separator wants are **HARD FACTS**—not fanciful nonsense and alluring misrepresentation.

He doesn't care much for silly ditties about "big brother" and "little sister" separators; nor "high" and "low" feed twaddle which means nothing to any one; and he may well steer clear of fake skim-milk "records" which have no actual foundation.

But what does concern him are these HARD FACTS—

That a De Laval Cream Separator is as much superior to imitating machines as such other separators are to gravity setting systems.

That protecting patents make and keep them so—together with far greater experience and superior facilities in every way for cream separator manufacture.

That every big and experienced user of cream separators knows this and uses De Laval machines exclusively—both in factory and farm sizes.

That it is as foolish to-day to buy other than a De Laval separator as it would be to buy an old-fashioned reaper if an up-to-date combined mower and reaper could be had for the same money.

These are simple **HARD FACTS** plain to any one. A machine itself will best illustrate them. The nearest local agent will be glad to arrange this to your own satisfaction.

READING NOTICES.

All Reading Notices under this head are at the rate of 25 cents per line.

Wanted—Single man on large dairy. Only good milkers need apply. F. W. ADAMSON, Lake Bluff, Ill. 4-tf.

For Sale—A good dairy farm of 50 acres, all tillable, located one and one-half miles from city of 30000 inhabitants. A new silo, and good barn for 25 cows and 5 horses. Will sell farm alone or will also sell cows and all necessary equipment for wholesale and retail milk business including route. Address T. C. WILSON, West La Fayette, Ind. 3-2t.

For Sale—Large and well equipped creamery and ice cream plant in leading southern city of 125,000 population. Paying $3,000 profit annually and can be increased. Steam boiler, engine, churn, butter worker, separator, Babcock test, bottle washer and ice cream plant (wholesale ice cream trade year round). Wagons, horses, office fixtures, etc. Office, creamery, and stables all under one roof. Requires ($7,000) seven thousand dollars. Satisfactory reasons for selling. Write for particulars to "ICE CREAM," care Hoard's Dairyman. 3-tf

For Sale—One of the best established dairies in the south. 130 head cattle—Jerseys, Guernseys and Holsteins. Can sell 200 gallons milk per day at an average of 30 cents per gallon. Farming and pasture lands rent very cheap. Good reason for selling. Address J. W. EDENFIELD, 408 Montgomery St., Savanna, Ga. 3-3

For Sale—Desirable dairy business with full equipment, consisting of horses, cows, farm tools, wagons, roxtes, etc. Leading dairy business in town of 12,000. Milk bottled. A bargain if sold at once. None but up-to-date dairymen need apply. Reason for selling—poor health. Address BOX 416, Elyra. Ohio. 3-tf

For Rent—A 160-acre dairy farm. Good buildings and strong soil. Established milk route. Address W. A. POWELL, Marshall, Mich. 3-2

Guernsey Bulls—Best blood, 2 Experiment Station tests. WM. BLACK, Mt. Vernon, Ind. 3-2

For Sale—The entire outfit for making American cheese; all in good order. Will be sold at a bargain. JAMES VIPOND, Shullsburg, Wis. 4-4

Do You Want—A Hay Fork Returner? Every farmer having a barn should have one. A hummer for agents. Circulars free. ROONEY RETURNER CO., Box D., Independence Iowa. 50-tf

Wanted—A married man with small or no family to work on dairy farm. Must be a good farm hand and good milker. Give age, experience and wages wanted. For particulars, address BELLEVUE FARM, Negaunee, Mich. 1-tf

Buff Jersey's Son, 23 years of age, will accept a position of trust on horse breeding, cattle feeding or dairy farm. Fully competent to manage up-to-date farm or ranch along any of the above lines. No bad habits whatever. Address BUFF JERSEY, Monmouth, Ill. 1-4

For Sale—Creamery in good condition Well located. Good trade. W. D. COE, Washington C. H., Ohio. 3-2

Buttermaker Wanted—We want to hire a buttermaker whom we furnish with an assistant. Send recommendations, state salary wanted per month and experience with application to the secretary before March 21, 1903, or apply personally at the director's meeting at creamery March 21, 1903 The directors reserve right to reject any or all bids THE FARMERS' CO-OPERATIVE CREAMERY AND COMMERCIAL CO., Peter Ameson, Sec., Waterville, Iowa. 4-2

For Sale—35 grade Holstein heifers, 13 to freshen soon and fine 3 year-old registered bull. Also American cheese and Prime Ost making outfit. HENRY AMES, Litchfield, Minn.

For Sale—Only milk route in thriving town: 20 cows; 90 acre farm and implements. Building new. W. H. BOARDMAN, Vassar, Mich.

Buttermaker and Dairyman Wanted—Married; house fully furnished; no objections to children. Address J. A. DOOLITTLE, Wallingford, Conn.

Wanted—To rent a creamery that handles eight to ten thousand lbs. of milk daily in summer. Or would hire to right party to manage business. Ten years a successful creamery manager. Understand testing, pasteurizing and all creamery machines. Milk expert. No. 1 references. Correspondence solicited. Address BOX 46. Candor, N. Y.

Experienced Buttermaker wants position in up to date creamery or high class private dairy. Applicant is a graduate of Cornell Dairy School and can give best of references from present employer. Is single, an American, and twenty-six years of age. H. L. KLING, Box 162, Port Chester, N. Y.

A Married Man 30 years old, would like to correspond with parties in need of a competent man to take charge of good sized farm about April 1st. I can put the right farm on a good paying basis. Third year in present place. Good reference given. MARK HOPKINS, Jonesville, Mich. 4-2

For Sale—A fine yearling Holstein bull sired by an extra well bred grandson of DeKol 2d and from a dam of great excellence. A persistent and large milker. T. J. JUHAN, Fort Dodge, Ia. 3-2

Buff Jersey's latest book on Farm Stock and Dairy Work is full of practical things for practical people. The Silo, how to build and fill; ensilage, its value; soil, crops, variety and how to grow. Swine, poultry and many other subjects ably treated. Send 25c for copy. Monmouth, Ill. 47-tf

Wanted—Experienced farm hand, able to milk well. Give age and wages wanted. ST. IVES PARK FARM, Mont Clare Station, Chicago, Ill. 41-tf

For Sale—The Prairie Farm, 840 acres. May be divided into five farms with buildings. In high state of cultivation, 16 miles from Toledo. One hundred cows, selected for 40 years. Terms to suit. 5%. Address E. L. LOCKWOOD, Petersburg, Mich. 46-tf

Position Wanted—As butter maker or manager of creamery. Understand all details of creamery business and work. Fifteen years experience. Make cheese also. Best of references. Address B care Hoard's Dairyman. 47-tf

Guernsey Cattle—Clover Knoll herd. Send for circular. M. SAGER, Orangeville, Pa. 50-12

Guernsey Grade Heifer—For Sale 10 Guernsey grade young heifers. Seven of the lot 1 year old; 3 six months old, all in fine condition. Just right to serve as the foundation of a fine dairy. A finely bred young bull, 10 months old, registered Guernsey, to head the bunch. These heifers were bred from some of my finest grade Guernsey and Jersey cows. The lot will be sold at reasonable price. W. D. HOARD, Fort Atkinson, Wis. 52-tf

Wanted for California—Steady, temperate, reliable man experienced in farming, milking, feeding and raising thoroughbred Holstein or Jersey cattle. Good chance for right man for work by the year in this beautiful climate. State age, nationality, qualifications, wages expected, also any physical impediments. References. WILLIAM NILES, Los Angeles, Cal. 4-2

Cheese Outfit for Sale—1 Helmer's Automatic Steel Gang Cheese Press for 14½ inch hoops (new), 1 Helmer Plain Steel Press 14½ inch hoops (new), 12 galvanized 14½ inch cheese hoops (seamless), 14 tinned 14½ inch cheese hoops (seamless), 1 Schaubb power curd mill, 1 Pohl curd mill, 2 set curd knives, in fact two complete cheese outfits for sale at a bargain. RIPON CHEESE FACTORY-CREAMERY, Ripon, Wis. 4-4

A Few First-Class managers and buttermakers. Open at once. Best of references. No charges to employers. Save time by writing THE SCIENCE AGENCY, Durham, N. H. 4-5

For Sale—Dairy farm—one hundred acres with elegant dwelling, tenant house, large barn and silos, cows and everything necessary with a first-class, well established 50 gallon per day milk trade. Address C. A. SNOW, Athens, Ohio. 4-2

For Sale—Milk route, horses, harness, wagon, cans, tickets, etc. A nearly new and very complete outfit. Present net earnings about $150 co per month. A splendid business opportuity Apply to JOHN L. FISHER, Hayes Block, Janesville, Wis. 4-2

Guernseys For Sale—Pure bred bulls and grade heifers. A. H. HINMAN, Neenah, Wis. 52-4

Which Breed?

The Holstein Advocated.

ED. HOARD'S DAIRYMAN:—Under the above heading I noticed an article from A. R. F. taking exceptions to your advice to Mrs. R. B. B. as to Holsteins. This party states that he is a Jersey admirer. Some who belong to that class are blind and prejudiced, others make rash statements with no valid evidence to back it. HOARD'S DAIRYMAN belongs to no particular class, its editors stand ready to back their statements. They state the facts, and the public are at liberty to draw their conclusions. I have seen it recommend Jersey, Guernsey, Ayrshire and Holstein bulls to head herds that belonged to its readers. It stands for no particular breed, but for the best dairy cow from whatever breed.

It needs no assistance from me to back up its assertions, but as I am seeking light perhaps A. R. F. or some of your readers would turn it on. He asserts that the Holsteins rank 4 or 5 in the dairy breeds. Can it be possible that I have been deceived. I thought they ranked first. A Holstein cow giving 60 lbs. of milk in a day and making 15 lbs. of butter in a week, will eat twice as much as a Jersey giving 40 lbs. making from 15 to 25 lbs. butter in a week, and as to Ayrshires the "Holsteins are simply not in it." Jersey cow making 25 lbs. butter in 7 days, where is she? I could not find her at the World's Fair, Chicago, nor at the Trans-Mississippi at Omaha, or the Pan-American at Buffalo. Is there a cow of that breed in the United States that has made 25 lbs. butter in 7 days under the Supervision of any of our state colleges or experimenting stations? I know of many Holsteins that have made 25 lbs. and more of butter in 7 days under supervision of these stations.

Under Cornell University we have Helena Burk, 654⅛ lbs. milk and 25.44 lbs. butter in 7 days. Netherland Hengerveld, 544⅞ lbs. milk and 26.66 lbs. butter in 7 days. Burley Wayne 608 lbs. milk and 27.87 lbs. butter in 7 days. Lilith Paula DeKol 658.8 lbs. milk and 28.24 lbs. butter in 7 days as a 4-year-old. Katy Spafford a 3 year-old 590.7 lbs. milk and 26.04 lbs. butter in 7 days.

Fidessa under Supervision of California Station gave 570.7 lbs milk and 25.6 lbs. butter in 7 days, Aaltje Posch in her 2 year-old form gave under the supervision of Ontario Station, 586.5 lbs. milk and 27.07 lbs. butter in 7 days, while Mercedes Julip's Pietertje gave under supervision of the Minnesota Station, 584 lbs. milk and 29.38 lbs. butter in 7 days. These are but a small portion of the many records made by cows of this breed under supervision of these Stations, that run from 25 to over 29 lbs. of butter in 7 days.

In the 18th report of the Wisconsin Station of June 30th, 1901 on page 97, we find there has been tested by these officers in the United States, 153 Jerseys, their average daily yield was 24.5 lbs. milk and 1.26 lbs. butter fat. We find 18 Ayrshires whose average yield was 27.7 lbs. milk and 1.07 lbs. fat, besides these, 8 other breeds were tested. Of the Holstein-Friesians 493 were tested with an average daily yield of 48.9 lbs. of milk and 1.61 lbs. butter fat; nowhere does any other breed in this country anywhere near equal this production.

It is well to assume that all of these cows were among the best of their breed and the picture would indeed be interesting if 153 of these best Holstein records were placed beside of these Jerseys. Not only would it establish before the eye the utterly fallacy of such statements, that the Holsteins are 4th or 5th in dairy breeds, but the utter ignorance of, or the unreliability of such statements made by these partisan men. The truth will hurt no man, while the reverse might do him great injustice. If I understand right the Holsteins have won three-fourths of the public butter tests in this country and against all breeds; that their butter capacity is acknowledged by the leading dairymen as well as the leading Agricultural and Dairy press of America.

It is now asserted by some of the Jersey breeders and some others that the Jersey breed make butter at a less cost per pound then Holsteins and that the cost per pound must determine the real value of a breed as a butter breed. Unfortunately we have as yet not much data upon this point; we have however the cost per pound of the 24 Jersey cows that were in the dairy test at the World's Fair, Chicago; their average cost per pound of butter was 13.64 cents per pound. The cheapest butter was made by Merry Maiden at 11.66 cents per pound, and the highest was made by Grace Pansy 2nd 15.20 cents per pound. During the year, May 15th, 1901 to May 15th, 1902, we find that 62 Holstein-Friesian cows and heifers ranging from yearlings to 13-year-olds were tested in the United States, under supervision of State Institutions and by them a record of cost of such production, keep and the average cost per pound of butter was 7.58 cents per pound; the cheapest was made by Mercedes Julip's Pietertje who made 29.38 lbs. butter in 7 days at a cost of 3.8 cents per pound, and the largest cost was made by a two-year-old at a cost of 11.5 cents per pound. But 7 cows in the batch made butter at a cost of over 10 cents per pound, and 3 of these were from one herd, which might indicate that it was the feeder and not the cow that was to blame; 10 of these or nearly one-sixth of the batch made butter at less than 6 cents per pound.

Now Mr. Editor, if there is any other breed of cattle that can equal these showings, I would be grateful if some of your readers would give us the information, but I do not wish for mere opinions or assertions unless they are backed by the evidence. It is useless as well as ungrateful to lead the unlearned estray by unsustained remarks. The truth alone can survive; as to the Buffalo test, the Holsteins gave over 6,000 lbs. more than any other breed, and made 33 lbs. more butter than their nearest competitors, and won the test against all breeds, as they have of 90 per cent of all the other public butter tests in the United States. If the figures I state are true, the DAIRYMAN'S recommendation stands unim-

THE CHAUTAUQUA

A COMBINED CHURN AND WORKER FOR HALF THE MONEY

Read this from one of the best Creamery Combinations in Western New York.

OAKES & BURGER, Cattaraugus, N. Y. WILLINK, N. Y., December 28th, 1902

GENTLEMEN:—We purchased two Chautauqua churns of you in the spring of 1902 and wish to recommend the Chautauqua churn as the best combined churn and butter worker on the market without exception. We have a Victor which is a good combined machine, but prefer the Chautauqua as it is made by your firm, to any other worker. We work our butter in less than 15 minutes and it is neither salvy or streaked. (Signed) Yours truly, COLE & FISH.

What is Meant by the Term "Dairy Temperament.

ED. HOARD'S DAIRYMAN:—I have been a subscriber to your paper but a short time and I am very much interested in it so far. But, dear Editor, I would like for you to explain something in the Rev. J. D. Detrich's address printed on page 1104. "Temperament," he says, makes all the difference in the world. How are we at the foot of the ladder going to profit by that assertion, when we are not told one word as to what or how we are to know beef temperament from dairy temperament. "The care of the calf should begin soon as the mother has been bred." That is all right so far as it goes, but what are we to do to that mother? Now, Mr. Editor, I am in all sincerity about this matter; if there is any way whereby a new beginner can know these things, I am very anxious to know. That is why I am a reader of HOARD'S DAIRYMAN. PRESS B. CAMPBELL.
Spokane, Wash.

At the close of Mr. Detrich's address which Mr. Campbell refers, we gave a brief statement of the office of that "inner something" or quality which distinguishes the dairy cow from the beef cow, and which for the lack of a better term, years ago, we gave the name of "temperament." It is our idea that this difference in the function of animals is first determined temperamentally; that is, temperament decides whether the cow shall be a decided dairy or beef animal.

We believe—(1) That temperament decides function, whether it be the milk or beef function, which she is to serve.

(2) That it is function which decides the form she is to take.

(3) That form is the outer indication which enables us to judge of the course the animal will pursue.

So in judging, we first decide on the form; that gives us an idea of the function she is committed to, in her life work; and through both form and function we decide as to the ruling temperament to which the animal belongs.

It is temperament which stands at the parting of the ways and decides the future character of the animal.

We judge of "temperament," first, by form, and if we wish to know whether it is an established temperament, we look to the antecedent breeding of the animal. So we look to pedigree. Has it been bred for generations in constant line of this or that temperament? If so, then we have additional proof of its stability, and assurance that the animal, if mated with another of agreeing temperament, will produce after its kind.

Many cows of a beef temperament show dairy capacity and often show decided dairy form. But the line of heredity has been broken up and there is no certainty that they will breed or reproduce in the dairy line.

Two things therefore, are necessary in deciding that a male or female has dairy temperament: (1) A decided dairy form; (2) a long line of unbroken dairy heredity. The longer the line of heredity, the more decided as a rule, will be the dairy prepotency of the animal in this given line. No new beginner can at once secure a close judgment on these questions. It takes time and study. But he can commence to learn, and if he starts right, with sound physiological premises, he will learn all the sooner and surer.

A Stable Plan for 100 Cows Wanted.

ED. HOARD'S DAIRYMAN: In writing this letter, I would like to know if you would give me a plan for a basement barn, on level ground, for 100 head of cows.

I want a cement floor. Which would you prefer for the cows to stand on, a cement or a plank floor? Do you think it would be best to put a butment under each post through the center, or set the posts on top of the cement floor?

I want 16 feet on top of basement up to plate. Which would you have for a foundation, a tile brick, or a common brick?

I want cows in two rows, heading one another and a driveway between them and behind each row.

I have two silo houses. I want them for a milk room, wagon shed and horse barn, 12 head of horses. The houses are 30x60 feet. Do you think they will be large enough? If so, I want them to join the new barn on east end. The houses are setting east and west. I want two round silo houses on west end of new barn, holding enough ensilage to run 100 cows for 9 months.

I think this is sufficient, just to give you a little sketch how I would like it built. E. B.
Maumee, O.

This is too much of a problem to be answered briefly and we have not the space at our command to go into full discussion of such a subject. A man who wants to build a barn and silos for 100 cows ought to have Prof. King's book entitled "Physics of Agriculture", where, among hundreds of other questions thoroughly discussed, the subjects of barn building and stable ventilation are very fully discussed. Possibly a round barn 100 feet in diameter as described on page 341 of that work would commend itself to this inquirer. Undoubtedly a barn built on this plan would cost for sheltering 100 cows and their feed less than any other style of structure, but whether it would afford the largest degree of convenience is perhaps an open question. Our own preference would be for a building at the corner 44 feet square, with wings extending at right angles 100 feet long by 44 feet wide, somewhat after he plan illustrated on page 938 of the preceding volume. We would use the central corner space for general administrative purposes, having a driveway 16 feet wide in the center, with trap doors that could be raised when necessary to take in hay, grain or feed. The silos we would place on the outside on either side of this doorway, each 24 feet in diameter and 30 feet deep.

The two buildings now used for silos could perhaps be attached to and communicated with this central administrative department and afford all the room required for wagons and the milk room.

Prof. King's book referred to above can be supplied from this office for $1.75.

SUPERIOR MERIT.

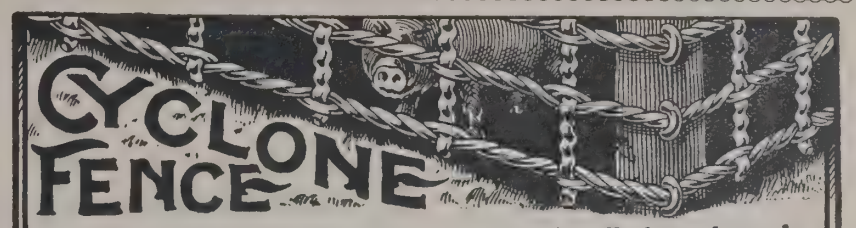
Remarkable Curative Properties of a Remedy for Indigestion and Stomach Weakness.

Stuart's Dyspepsia Tablets, a preparation for the cure of dyspepsia and the various forms of indigestion and stomach trouble, owes its great success as a cure for these troubles to the fact that it is prepared for disease and weakness of the stomach and digestive organs *only*, and is not recommended or advised for any other disease.

It is not a cure-all, but for any stomach trouble it is undoubtedly the *safest*, most sensible remedy that can be advised with the prospect of a permanent cure. It is prepared in tablet form, pleasant to taste, composed of vegetable and fruit essences, pure pepsin and Golden Seal, every one of which act effectively in digesting the food eaten, thereby resting and invigorating the weak stomach; *rest* is Nature's cure for any disease, but you cannot rest the *stomach* unless you put into it something that will do its work or assist in the digestion of food.

That is exactly what Stuart's Dyspepsia Tablets do, one grain of the digestive principle contained in them will digest 3,000 grains of meat, eggs or similar wholesome foods; they will digest the food whether the stomach is in working order or not, thereby nourishing the body and resting the stomach at the same time, and *rest* and *nourishment* is Nature's cure for any weakness.

In persons run down in flesh and appetite these tablets build up the strength and increase flesh, because they digest flesh-forming food which the weak stomach cannot do, they increase the flow of gastric juice and prevent fermentation, acidity and sour watery risings.



Stuart's Dyspepsia Tablets can be found at all drug stores at 50 cents per package.

Wouldn't Take a Lantern.

ED. HOARD'S DAIRYMAN:—A neighbor called at my house the other night and remained until it was very dark. When he came to go away I urged him to take my lantern to show him the road. He refused saying: "I guess I know the road, I've travelled over it for 30 years."

Before he got home he ran his wagon into a ditch, was overturned, and the team ran away killing one horse. A little cheap lantern light would have saved all this. Did he really know the way? Did he know as much as he thought he did? And he had travelled over the road, he said, "for 30 years."

Some of my neighbors are just like him about taking the DAIRYMAN. O! they "know the way." I find the DAIRYMAN lantern very handy. But I am only a woman you know, carrying on a farm. But my receipts per cow are the largest of any at this creamery, and that neighbor who would not take the lantern was at my house borrowing a hundred dollars to help him out. I was glad my cows were doing enough better so I could lend it to him. I am sorry for him, but what can you do with men who are so conceited that they don't know they need a lantern? Maybe I shouldn't have written this. But then, he will never see it, for he never reads the DAIRYMAN.

ONLY A WOMAN SUBSCRIBER.

Wayne Co., N. Y.

There is a world of clean-cut truth and cutting sarcasm in the foregoing. It's a good idea she works out, taking a lantern along, so as to see a good deal more than one would without it.

It is a curious thing, but true nevertheless, that there is hardly a woman in the United States or Canada who is carrying on a dairy farm that is not a reader of HOARD'S DAIRYMAN, if she has ever seen the paper. Another thing is true: We have a list of over a hundred such women that we have found in the United States and Canada, who are carrying on farms, and *every one is a success*. Women are not overwhelmed in their own conceit. They *will* take a lantern when it will do them any good. It is a pity they could not quite often run the farm in place of the husband, who don't know even that he needs a lantern.

Cooling Cheese Curing Rooms—Cooling Curd with Cold Water.

ED. HOARD'S DAIRYMAN:—I have read your paper with much interest for several years. It comes handy for me quite often, as I am in the cheese manufacturing business. Would like to ask a question or two. I am running a cheese factory on a small scale of from 1,400 pounds to 2,000 pounds per day through the summer season; have got just a common frame building which is ship-lapped inside and outside and it also has building paper between the two, and I also have another wall about 15 inches from the main building around the curing room made of barn siding which is battened up tight. Have small doors to open out over windows for light and air, but still this does not suit me for hot weather. Do you think it would pay me to put up ice to use through the summer or could ice be used to any advantage in making cheese or holding the temperature down in the curing room. Can curd be cooled with cold water in curd sink without injury? F. D. R.

Sandyville, Iowa.

ANSWERED BY U. S. BAER, AGRICULTURAL EXPERIMENT STATION, MADISON, WIS.

In reply to your correspondent's first question, I would suggest that the subearth duct method of controlling the temperature and moisture in cheese curing rooms would be more economical and more satisfactory than cooling with ice. Another advantage with the duct is that it is always in running order and never needs attention, as would be required if ice boxes were constructed in the curing room. I have had very little experience in cooling curing rooms by means of ice, but judging from the letters of Wisconsin makers who have tried it extensively, they seem to be of the one opinion, that it hardly pays to put up ice for use in curing rooms, unless the ice-house and curing room are constructed together, that is, upon the cold storage principle.

There are two methods of cooling rooms by the use of ice. One of these is to place galvanized iron pans within a couple of feet of the ceiling of the room,

"ADVERTISEMENT."

A LAYMAN

Gave Doctor a Hint About Coffee.

Speaking of coffee a doctor of Decaturville, Ohio, says: "We used to analyze coffee at the Medical college and in spite of our laboratory tests which showed it to contain caffine, an active poison, I continued to use the drink, and later on found myself affected with serious stomach trouble, indigestion, headaches, etc.

The headaches came on so regularly and oppressed me so that I found it difficult to attend to my regular duties. One day last Nov. I met a friend whom I had known to be similarly afflicted. His marked improvement in appearance caused me to enquire what he had been doing. He announced that he had, some time ago, quit coffee and was using Postum Food Coffee. To this change he attributed the change in his health.

I took the hint, even from a layman, and made the same change myself. The first week I noticed a little difference but not much. The third week the change was almost magical. I have continued with the Postum and now my digestion is perfect, the nervous headaches have entirely disappeared, and I am well. My own analysis of the Postum Food Coffee shows it to be a pure food drink of strong character, which is a marked contrast to the old fashioned coffee." Name given by Postum Co., Battle Creek, Mich.

Good News to Stock Owners

Just the information that you must have to successfully treat Fistula, Poll Evil, Sweeny, Knee-Sprung, Curb, Splint, Spavin, Ringbone and all blemishes hard or soft, also Lump Jaw in cattle.

Bone Spavin Ringbone Lump Jaw

ST. OMER HERD
Offers young bulls fit for service, out of tested dams with good yearly records. Strong in Exile of St. L., King of St. L. and Stoke Pogis of Prospect. Reasonabe prices. JOS. T. HOOPES, Bynum, Md

Exile of St. Lambert
—13657—
is the sire of more tested Jersey cows than any bull living or dead, and the number to his credit will probably never be equaled by any other bull. His dam was one of the largest milkers among Jerseys, and is the dam of the three year old cow with the highest year's milk record for that age. Exile's sire is the grand sire of the cow holding the highest milk record for a year.
The mid-winter sale lists include a few tested daughters of this great bull and several cows and heifers deep in the blood that produced this famous sire. If you wish to improve your herd, or to start one, you will probably never have a better opportunity than is here offered. If interested write for lists, and please specify whether bulls, cows in milk, or heifers, are wanted.
WINTERGREEN HILL FARM,
Scottsville, N. Y

Biltmore Jerseys.
Have been Bred for work in the Dairy. Are from the choicest foundation that could be bought. Include more Prize Winners than any other Herd. Are robust, true to type and of great capacity. Are noted for large milk yields, perfect udders and teats. All tuberculin tested for the last seven years.
FOR SALE—Young Bulls from selected dams. Send full details, mentioning defects you wish to correct, blood lines, etc., and we will quote promptly, reasonably, with guaranteed description and full pedigree. Apply to
BILTMORE FARMS,
Biltmore, N. C.

THAT NEW BULL

Address, E. E. STEVENS,
North Madison, Lake Co., Ohio.

The Evergreen Farm Herd has for sale three or four A. J. C. C. heifers bred. Also a few cows and some choice bull calves from two to six months old. Write for pedigrees and prices.
N. N. PALMER & SON, Brodhead, Wis.

FOR SALE. Clear View Stock Farm offers a few choice registered Jersey Bull Calves from 5 to 12 months old. Prices low if taken at once as must have the room.
J. S. CAMPBELL, Prop.,
Butler, Pa

using crushed ice and salt in these pans. I think perhaps a better method would be to construct an ice-box of 2-inch lumber covered on the outside and the inside with galvanized iron; this could be set on legs ten or twelve inches from the floor and two by four pieces set edgewise in the bottom to place the ice on; below the ice there should be a shelf made of galvanized iron extending from side to side of the box with flow enough to carry off the water, thus permitting the air to come in contact with the water. This box should have an air tight cover which can be opened and closed as desired. In a room of three thousand cubic feet a box of from twenty to twenty-five cubic feet would be required in order to maintain uniform temperatures. With the data at hand there is no question but that the so-called sub-earth duct system of cooling curing rooms is much preferable to that of ice used in the manner mentioned

With reference to the second question I would say that I have advised people in very warm weather to try the use of cold water on the curd. I could not see that it would do any harm so long as the curd was not left in the water too long; simply rinsing it with cold water, leaving it in a minute or so to lower the temperature. I do not advocate anything particularly in this line. I think, however, in hot weather when the factory is very warm, and we have curds that could be handled better if the temperature was lower at time of salting and pressing and there was no other way to lower it, I think I should dash a few pails of well water over the curd. I would suggest that the gentleman experiment to his own satisfaction.

We carried on quite a number of experiments to illustrate the results of rinsing curds at different temperatures and the effect on the quality of cheese as compared with unrinsed goods. We found that by rinsing the curds we would make cheese of more uniform quality and better keeping quality. They were somewhat better in flavor and the color was usually brighter and more transparent. This rinsing is done with water at a temperature of 94 to 98 degrees Farenheit just prior to the application of salt. This removes the free fat and thick white whey from the surface of the curd particles. I do not believe in washing curds to any extent, as in another series of experiments we found that curds washed repeatedly made very poor cheese; in fact, the curing was materially retarded and the flavors developed were very objectionable.

Annual Meeting Ayrshire Breeders' Association.

ED. HOARD'S DAIRYMAN:—The 28th annual meeting of the Ayrshire Breeders' Association was held at the Fifth Avenue Hotel, New York, January 29, 1903, with about fifty members and visitors present.

The officers elected were: Geo. H. Yeaton, Dover, N. H., president; Obadiah Brown, Providence, R. I., Thomas Turnbull, Jr., Casanova, Va., Charles C. Doe, South Newbury. Vt., E. J. Fletcher, Greenfield, N. H., vice-presidents; C. M. Winslow, Brandon, Vt., secretary; N. S. Winsor, Greenville, R. I., treasurer; J. F. Converse, Woodville, R, I., J. Andrew Casterline, Dover, N. J., executive committee for three years. The report of the treasurer showed about $5,000 in treasury. The report of the secretary showed a removal by death of six members and twenty-four new members added.

It was voted to continue the Home Dairy test for the next year with the same premiums.

It was voted to make an exhibit of Ayrshires in the Dairy Test at St. Louis in 1904, and to assist members in making a creditable show of Ayrshires in the ring at St. Louis.

Twenty-four dined together and after dinner for about two hours the different members spoke on subjects of interest.

C. M. WINSLOW, Secretary.
Brandon, Vt.

Cleaning Milk with Separator.

ED. HOARD'S DAIRYMAN:—Being in the milk business, would like to ask through the DAIRYMAN if any milkman has tried running their milk through a cream separator and then mixing it together again. What advantage is it in regard to keeping the milk sweet longer, and does it improve or injure the milk and in what way? SCOTNEY BROS.

Michigan.

It does not improve milk that has been kept or shipped to run it through a separator as the soluble dirt has gone into solution, and cannot be removed. If the milk can be run through the separator as soon as it is produced, the process helps materially in its cleanliness and keeping qualities. An objection to this method of handling milk, is that the cream does not rise as well as on fresh milk, and the customer usually judges of milk by the amount of cream that rises.

TIME, MONEY AND LABOR SAVED

CHILD'S PATENT

MILK BOTTLE FILLER.

EVERY progressive dairyman wants the easiest, cleanest and best bottling machine on the market provided he can get it at the right price. He will find on investigation that CHILD'S PATENT MILK BOTTLE FILLER answers all of these requirements. It was awarded the only prize for Automatic Milk Bottle Fillers at the Paris Exposition of 1900, and it has remained ever since absolutely the best machine of the kind on the market. It possesses many labor-saving devices which are more fully described in our illustrated free catalogue and which will fully commend it to the observing dairyman. It is so simple in construction that a child could operate it. Write today for full particulars.

J. S. BIESECKER,
59 Murray St., New York City.

Before ordering supplies for your dairy, or creamery, get our prices and save money. Hundreds of satisfied customers can testify to our business methods.

BIG PROFIT IN HOGS.

The hog question is an interesting one. Some farmers are much more successful than others. It is a big difference whether you get 8 lbs or 17 lbs of pork out of a bushel of corn fed to hogs, or 19 lbs out of a bushel of wheat. No other animal will give the number of pounds of gain for feed consumed that hogs will. They are the farmer's mortgage lifter.

The AMERICAN SWINEHERD is a specialist and the best authority on the hog industry. Its success is attained by concentrating on one line.

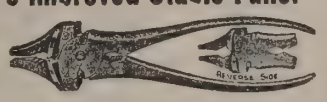
Professor Henry says that success comes through devoting all efforts into one channel.

Professor Kennedy of the Iowa Agricultural College says "Your paper is a leader on the feed question."

A 2 years' course in hog raising.
Teaching how to be successful.
How to make the greatest profit.
How to get 17 pounds of pork out of a bushel of corn.
How to get 19 pounds of pork out of a bushel of wheat.
How to double the growth and gain over usual methods.
How to keep your hogs healthy.
How to utalize without expense the costly experience and gathered wisdom of capable and successful feeders and breeders of swine.

No one interested in hogs can afford to overlook nor fail to take advantage of this special offer.

Send us $1.00 for 2 years' subscription to the AMERICAN SWINEHERD, and it will entitle you to a free copy of our HAND-BOOK on "HOG HYGIENE" with trade secrets, recipes, feeding tables, valuable information, etc. This will equip you for successful and profitable hog raising.



If this offer is accepted within 10 days we will send you in addition a wonderfully suggestive picture in colors, "Uninvited Guests", showing the pigs partaking of a meal uninvited.

This gives you $5.00 for $1.00, and 2 years' schooling in successful hog raising.

If you accept this offer you will want the paper as long as you are interested in swine.

Address: AMERICAN SWINEHERD,
535 Como Bldg., Chicago, Ill.

Cronk's Improved Staple Puller

is at the front. Ask your dealer to show it. Three wire cutters, two hammers, two splicing clamps—all in one tool. A staple puller that will pull staples when no other make will. A cutter that will reach wire when the button cutter will not. One day's use will save the cost of it. $1.00, postage paid.

AVERILL & GREGORY, The Yates, Syracuse, N. Y.

Iowa State Dairy Association.

The twenty-sixth annual meeting of the Iowa State Dairy Association was held at Cedar Rapids Feb. 3, 4 and 5. The attendance, though fair, would have been greatly increased had not the most severe snow storm of the season enrolled itself among the delegates at the opening session.

The meetings were held in the Auditorium, where the exhibits were pleasingly displayed in artistic booths under the balcony, and chairs arranged on the ground floor comfortably seated the convention. The butter room, situated on the second floor, was opened to the public on Thursday morning.

There were 97 entries of butter, of which only two were in the dairy class. The highest score in the creamery class was awarded to H. J. Evans, Strawberry Point, whose score was 97.5. S. Peterson, of New Hampton, held a close second with 97.25 points. Third, P. M. Jeun, Toronto, 96.5. In the dairy class, M. S. Barber, Marion, scored 90, the other contestant being D. J. De Hough, of Boyden, score not announced. As a whole the butter was very good for this season of the year, and Prof. McKay, the expert in charge, commented favorably upon it.

The convention was called to order promptly at 7:30 Tuesday evening by President S. B. Shilling. After the invocation Mayor C. H. Huston cordially welcomed the convention on behalf of the city. H. J. Neitirt, of Walker, president of the National Buttermakers' Association, responded for the delegates.

Pres. Shilling in his annual address, which followed, reviewed the work of his administration, tending to the improvement of Iowa high grade butter. Action was necessary, he said, for Iowa, the oldest dairy state in the country, held the lowest average of all the states at the Milwaukee convention. He gave as one of the reasons for this state of affairs the exceeding large number of creameries,—900 compared to the other states, where few possess three hundred.

The failure of the legislature to appropriate funds to advance dairy interests also lowered Iowa's standard He scored the legislature heavily. In touching phrases he spoke of John Stewart, who built the first creamery in Iowa, at Delaware, but whose grave near Anamosa still remains unmarked. He expressed the hope that the dairymen of the state would show their appreciation of the labors of this pioneer by erecting over his grave a suitable monument. He closed by advocating a graduated license law for buttermakers.

H. R. Wrignt, of DesMoines, "live" dairy commissioner, so introduced, gave an interesting talk on the possibilities of Iowa, as a dairy state.

"The Kicking Heifer in Fly Time" was treated by J. S. Triggs in his usual pleasing style.

The convention did not assemble until Wednesday afternoon, as the morning was givun over to the machinery exhibits. W. B. Barney, Hampton, opened the program wfth his paper on "Silos for Iowa Dairymen." His address was full of pointed information.

"The Profitable Dairy Cow" by J. N. Munsey, and "Creamery Centralization," by C. B. Hubbard, both of Independence, deserve greater mention than our space will allow. The last on the program for the afternoon session was a discussion or debate, "Hand Separator *vs.* Whole Milk System," lead by prominent members. Except in a few minor points, the hand separator system was easily proved superior from facts submitted by those who have tested it.

Prof. C. F. Curtiss of the state college at Ames, addressed the evening session on "Modern Dairying." Chas. Y. Knight of the National Dairy Union, gave a short talk on the oleomargarine question. He reviewed the main steps taken against this fraud, showed the results accomplished under the present law, warned the dairymen against the dangers of engaging the process butter faction against them, and closed by urging renewed support from all in the fight before the next Congress.

Thursday morning the scores were given out and the butter opened to inspection. At eleven o'clock the meeting was called to order for the election of officers. The new officers are as follows: President, S. B. Shilling, Mason City; Vice President, W. B. Barney, Hampton; Secretary, P. H. Kieffer, Strawberry Point; Treas., F. A. Leighton, New Hampton.

The convention closed Thursday afternoon, after a well-attended and interesting session.

THE RESOLUTIONS.

The committee on resolutions submitted the following report which was adopted by the convention:

We, your committee on resolutions, beg leave to submit the following resolutions, and respectfully recommend their adoption:

WHEREAS, We desire to express our appreciation of the loyalty and co-operation of our efficient Secretary of Agriculture, Hon. James Wilson, who has ever been the faithful friend and defender of dairy interests, and,

WHEREAS, We realize with regret that the present chief of the dairy division of the Bureau of Animal Industry of the Agricultural department of the United States is not in sympathy with the dairy sentiment of this country upon important matters, and such lack of sympathy is the cause of friction which has practically nullified his usefulness in that capacity, therefore, be it

Resolved, That we urgently request the appointment of some competent man to fill this position at as early a date as possible. And be it further

Resolved, That the secretary of this association be instructed to send a copy of these resolutions to the Secretary of Agriculture, as an expression of the desire of the dairymen of Iowa.

Resolved, That we return many thanks to the officers of the National Dairy Union as a partial expression of our appreciation of their untiring and able efforts in behalf of the dairymen and honest butter in securing the passage by Congress of the oleomargarine law of 1902.

Resolved, That we also extend our thanks to Senators Allison and Dolliver, and our representatives in Congress for their loyalty to the dairymen and honest butter, and their valuable assistance in securing the enactment of our present oleomargarine law.

Resolved, That the Iowa State Dairy Association extends cordial greetings to the dairymen of the eastern states, and we hereby express the hope that the western contingent may meet them in their own country in joint convention in the near future.

Resolved, That the Iowa State Dairy association urges upon the Iowa World's Fair commission the importance of setting aside a fund sufficient to make a creditable exhibit of the dairy interests of this state at the Louisiana Purchase Exposition.

Resolved, That the Iowa State Dairy Association express its profound gratitude for the generous treatment and cordial hospitality accorded us by the Cedar Rapids Hotel Men's association and the citizens of Cedar Rapids generally.

Resolved, That we thank the railroads leading into this city for courtesies shown, and the granting of low rates for the delegates,

WHEREAS, John C. Daly, has retired from the secretaryship of this association, be it

Resolved, That for his many years of faithful service, and his zealous work in behalf of the association and the dairy interests of the state at large, he is entitled to the sincere and hearty thanks of every member of this association.

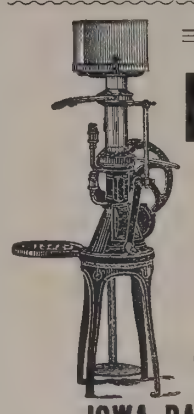
Resolved, That this association appreciates the good results already obtained and to be secured through the work of expert instructors of dairymen and buttermakers; and that the magnitude of the dairy industry of this state warrants us in asking that the next session of the legislature give authority for the appointment of five additional dairy commissioners, to the end that the profits of the dairy people of the state may be increased, and the industry further developed.

Resolved, That we most heartily endorse and recommend the appointment of Mr. Edward Sudendorf as superintendent of the dairy exhibit at the Louisiana Purchase Dairy exposition, whose peculiar fitness for the place is everywhere recognized.

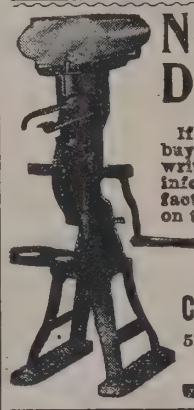
Pennsylvania Pickings.

Beef vs. Butter.

ED. HOARD'S DAIRYMAN:—We had a good many dairymen scattered over the country who, about this time last year, began quietly turning their attention from cows to steers—not that butter was not a fair price, but beef was soaring and had money in it. There were other dairymen who, while not discarding their cows, went sky-larking after that mythical ani-



THE ESQUIMO



The Esquimo eats blubber. The lumbermen eat pork. These people are constantly exposed to cold and physical strain. Experience has taught them that fatty foods give warmth and nourishment.

For those who have cold and thin bodies, or are threatened with consumption or any wasting disease, there is no fat in so digestible and palatable a form as Scott's Emulsion. Physicians prescribe it.

We'll send you a little to try, if you like.
SCOTT & BOWNE, 409 Pearl street, New York

Newark, N. J.

Reid's Hand SEPARATOR

The "best" separator is that one which does its work most thoroughly and easily, that is built of strongest material, and that is most easily washed and kept in order.

First cost is a great point with a buyer, but ease of running, perfection of skimming and simplicity in washing are even greater considerations.

The **Reid Hand Separator** has but a single cylinder inside the bowl, and skims as closely as one-hundredth of one per cent. Indeed, some tests indicate "not a trace" of fat in the skim milk.

The Reid is perfectly planned and strongly built, and it literally "runs like a watch."

As to our guarantee of excellence, we make the strongest statement that can be expressed in words: **Money back (less freight) if the buyer is not satisfied.**

There is a new (free) booklet about the Reid Hand Separator.

Sizes run from 150 lbs. to 500 lbs. per hour.

A. H. REID
CREAMERY AND DAIRY SUPPLY CO.,
PHILADELPHIA, PA.

ERIE CAN REFRIGERATORS should be used on all milk cans from April to Oct. Prevent sour and churned milk. Booklet free. S. C. SULLIVAN, M'f'g., Erie. Pa

mal known as the general-purpose cow, with the accommodating capacity of making milk when it was wanted, or making beef when it was in demand.

Now, such quick turns do the humors of trade make that at this time our market in Philadelphia is so full of medium beef that it is a drug, and many of our sensational farmers, who dropped cows and picked up steers at pretty stiff prices, are confronted with lower prices for fat cattle than they paid for the same cattle as stockers.

I do not make this record with any feeling but one of sympathy for those who have found the new venture unprofitable, but underlying this market mutation is the everlasting lesson of stick-to-ativeness that we, farmers and dairymen and cattlemen, need to learn.

The divorce business in agriculture is playing out. When we go into growing corn or potatoes, or making milk or butter or beef, we want to do it for better or worse, stand by our choice and keep up even with the fellows who are doing the very best at it.

STATE TESTING MILK.

Some State Senator has introduced a bill known as the Senate Bill 104, into the Senate at Harrisburg to provide for the appointment of a state milk and cream inspector or tester. He shall have a certificate from the Dean of State College that he is competent to judge of acid, examine bottles and turn the Babcock. He shall be around where milk and cream are sold by the Babcock test and see that there is no cheating going on. There shall be as many of these inspectors appointed at $5 a day etc., as the Dairy and Food Commissioner finds necessary to cover the state.

I do not believe that the dairymen and creamerymen want any such a bill erected into a law, for I am sure any differences that may exist between the sellers and buyers of milk can be adjusted by themselves.

Citizens of Pennsylvania may head off a pernicious enactment of this kind if they will at once, upon reading this, write their representatives at Harrisburg protesting against the passage of Senate Bill 104.

DISTRUST.

This element that exists to such an unfortunate extent on the part of dairymen toward the creamerymen to whom they sell milk, is very unfortunate in a business relationship and is bound to be distracting in mutual co-operation necessary to the success of both parties.

There are many instances in which the Babcock test is in the hands of dishonest or tricky manipulators, and proportionately as many evidences of dishonesty chargable to the producers of the milk. Happily for our faith in our fellows, it is easy to believe that the systematic practice of dishonesty on the part of either is the exception and not the rule.

My observation has been that the average creameryman, by the very force of acute competition, is paying all he can afford to pay, and is always willing that the interested patron shall witness his testing operations.

It is true, I think also that the most complaining about the test comes from those men who are most ignorant, have no faith in "book farmin'" and will read no dairy papers, and to whom the judgment of the acid test is a mystery, and is, therefore, entitled to their discredit. It is such a simple and inexpensive matter for the dairyman to himself own a Babcock or to club with his neighbors in in the ownership of one. that a check can be kept on the creameryman.

To do this is a duty each dairyman owes his own interests; and of such far reaching benefit would such a simple business precaution be, that its adoption all over our state would be the greatest single uplift our dairying has ever had. Its educational effect would be felt at once, and we would find a great weeding out among our cows; for while I am a most strenuous advocate of the farmer making all the manure he can, I would not advise his keeping animals for that purpose only.

I have read that our State Deputy Secretary of Agriculture and Director of Farmers' Institutes, when boasting of the wealth of the state, said that our cows made 140 pounds of butter each. If this authority knew what he was talking about, there must be very many of our cows making much less than 140 pounds for we have a great many making very much more. But if this authority is true, and makes the right average for our cows, then we are about keeping them for their manure.

A MILKING MACHINE.

The other day I attended a meeting of the Dairymen's Association of Eastern Pennsylvania, held in West Chester, Pa., and had the pleasure of inspecting the extensive separator works of Mr. P. M. Sharples, and of examining closely the new "Sharples Sympathetic, Pulsating Lactator." I think they will milk that name down, somewhat later.

It was not shown in the act of milking, but from its simplicity, apparent ease of management and its almost human adaptation to the needs of its business, it looks a success. While it may not reach the perfection of the conscientious, skilled milker, I feel sure it will surpass the work of the careless, dishonest or indifferent milker.

The machine is operated by producing, with a vacuum air pump, operated by any convenient power, a partial vacuum in a system of pipes over the cows. The milk pail is closed and from it runs a small rubber hose to the teat cups fitted to the cow's teats.

There has been no effort made to milk a cow in less time than a speedy hand milker would consume doing it, but the economy in the machine comes in by the man's being able to manage from four to eight buckets, and it is well known in these times of scarce laborers, it is easier to get a man to manage a machine than to manipulate teats.

W. F. McSPARRAN.

When is Milk from a Fresh Cow Fit for Food?

This inquiry is submitted by a Vermont reader. Cows vary somewhat in this particular. For ordinary purposes the milk is generally all right after three days, but for full assurance, many laws in the different states prescribe that milk shall not be used until the sixth day after freshening.

"ADVERTISEMENT."

THE VALUE OF CHARCOAL.

Few People Know How Useful it is in Preserving Health and Beauty.

Nearly everybody knows that charcoal is the safest and most efficient disinfectant and purifier in nature, but few realize its value when taken into the human system for the same cleansing purpose.

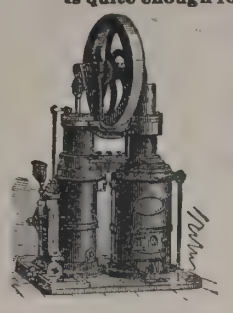
Charcoal is a remedy that the more you take of it the better; it is not a drug at all, but simply absorbs the gases and impurities always present in the stomach and intestines and carries them out of the system.

Charcoal sweetens the breath after smoking, drinking or after eating onions and other odorous vegetables.

Charcoal effectually clears and improves the complexion, it whitens the teeth and further acts as a natural and eminently safe cathartic.

It absorbs the injurious gases which collect in the stomach and bowels; it disinfects the mouth and throat from the poison of catarrh.

All druggists sell charcoal in one form or another, but probably the best charcoal and the most for the money is in Stuart's Absorbent Lozenges; they are composed of the finest powdered willow charcoal, and other harmless antiseptics in tablet form, or rather in the form of large, pleasant tasting lozenges, the charcoal being mixed with honey.



The daily use of these lozenges will soon tell in a much improved condition of the general health, better complexion, sweeter breath and purer blood, and the beauty of it is, that no possible harm can result from their continued use, but on the contrary, great benefit.

A Buffalo physician in speaking of the benefits of charcoal, says: "I advise Stuart's Absorbent Lozenges to all patients suffering from gas in stomach and bowels, and to clear the complexion and purify the breath, mouth and throat; I also believe the liver is greatly benefitted by the daily use of them; they cost but twenty-five cents a box at drug stores, and although in some sense a patent preparation, yet I believe I get more and better charcoal in Stuart's Absorbent Lozenges than in any of the ordinary charcoal tablets."

Cream SEPARATORS All about them and other things for the dairy and creamery.

New American Manure Spreaders

hold from 50 to 100 bushels. Spread just as thin or thick, fine or coarse, as ground requires. Don't have to stop team to make change. Most substantial, largest capacity, lightest draft.

Send today for Booklet B.

American Harrow Co
Detroit, Mich.

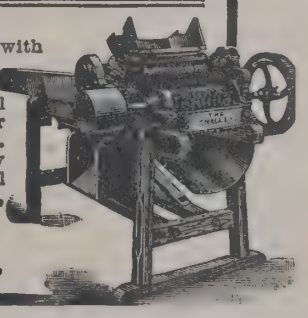
Made for the Man Who Wants the Best.

The Great Western Endless Apron Manure Spreader

spreads all kinds of manure, fresh, well rotted, fine, coarse, hard, mixed, full of straw, full of corn stalks, etc.

Will also spread **compost, lime, land plaster, salt, wood ashes, cotton seed and hulls,** and in every case do it quicker, better and more evenly than it can be done by hand. Spreads as much manure in one day as twelve men can load and spread by hand and the job is much better when done. Spreads the largest load a team can haul in 2 to 4 minutes. It makes the same amount of manure go three times as far and at the same time produce better results.

REGULATED to spread much or little while in motion. Puts it on thick on poor spots—2 to 25 loads per acre. **ENDLESS APRON**—always ready to load. No turning back into position with crank.



COMBINED HOOD AND END GATE keeps manure away from beater while loading and acts as hood in spreading. Catches all flying sticks, stones, etc. Front wheels cut under, and machine can be turned in its own length. Made in two styles and four sizes. Capacity 30 to 70 bushels. It saves **time, labor and money** and will double the crops. Makes all manure so fine and spreads it so evenly that it is immediately available for plant food.

LARGE CATALOGUE 10 by 13 inches, with 8 large cuts shows the spreader perfectly and describes it fully. Tells also how to apply manure to secure best results. **Mailed free.**

SMITH MANURE SPREADER CO., 55 N. JEFFERSON ST., CHICAGO, ILL.

The SMALLEY Fodder Shredder

The lightest running Fodder Shredder made. Operates with less power, handles fodder in best condition, and is less liable to breakage than any other shredder. Can be supplied with snapping rolls that will remove all the ears just the same as a husker. The Smalley Shredder is adapted to the handling of either green or dry fodder. Strong and durable, and will outlast a dozen of the saw pattern machines. Write for free catalogue that tells all about it, and also describes our Drag and Circular Saw, Sweep and Tread Powers, Ensilage Cutters and Carriers, Grinding Mills, etc. Address Dept. H.

SMALLEY MFG. CO., Manitowoc, Wis.

WINCHESTER
"NEW RIVAL"
FACTORY LOADED SHOTGUN SHELLS

Give these shells a thorough trial, and you will find them to be as nearly perfect as experience, ingenuity, brains and equipment can make them. They are made with the Winchester patent corrugated head, which has made Winchester "Leader" and "Repeater" Smokeless Powder Shells so popular and satisfactory. Winchester Factory-Loaded "*New Rival*" Shells are thoroughly waterproof, and are loaded by exact machinery with the standard brands of powder, shot and wadding which makes them uniform and reliable.

Shoot Them and You'll Shoot Well

VETERINARY.

Queries in this department answered by DR. A. H. HARTWIG, Watertown, Wis.

Lump Jaw.

I have a young thoroughbred bull which has a hard lump about the size of a man's fist behind the jaw, directly below the ear. It is not fast to the bone, but is loose under the skin near the wind pipe. Animal is in good condition.

Have a cow with lump in her teat. It is soft as though full of something. Has been there about a year and bothers in milking. E. P.
Ringwood, Ill.

ANSWER

The lump may be removed surgically with safety; also the lump on the teat, but the latter had better be removed when the cow is dry.

Te Prevent Breeding.

I have a large Angora cat (female) which I do not want to breed. Could you tell me of any remedy which will keep her from coming in heat?
North Adams, Mass. N. E. C. W.

ANSWER.

The only reliable way to keep any female from breeding is to spay her. This is a sure cure, and there is little or no danger in the operation. Employ a qualified veterinarian.

Pneumonia.

I wish you would give me through the DAIRYMAN a treatment for pneumonia, as that is something that troubles us considerably here. J. E. M.
Albuquerque, N. M.

ANSWER.

To treat pneumonia it is necessary to know what kind of pneumonia you are troubled with. Authorities recognize three or four kinds. It is also necessary to know the probable cause, in order to form an opinion, without a personal examination. Please give us a complete history of your trouble and carefully note the symptoms of each stage of the disease, and any other information which you may possess. We shall then be able to make an intelligent diagnosis and offer a remedy which will be productive of some good, rather than to guess wrong.

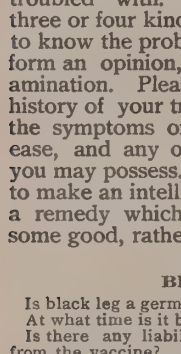
Black Leg.

Is black leg a germ diseae?
At what time is it best to vaccinate?
Is there any liability of producing ill effects from the vaccine?
Are are all cattle equally subject to it, or are cattle over three or four years of age subject to it at all? B. F. S.
Caltin, Wash.

ANSWER.

No. 1 Yes.
No. 2 Any time before they have contracted the disease.
No. 3 No.
No. 4 Yearlings and two-year-olds are most subject to this disease but it may attack cattle of any age.

Cribbing.



I have a mare colt rising two years old, and this fall she started cribbing. SUBSCRIBER.
Montinette, Ont.

ANSWER.

Cribbing is the result of idleness. Colts which are confined to the stable and are well fed contract this vice for pastime. Give her a box stall in which there is not possible chance to cribb, have no manger whatever, nor other possible place upon which she may place her teeth; feed from a shallow box on the floor in one corner of the stall and have your hay rack so high that she cannot arch her neck and commit the act. This is the safest way to remedy the evil, as they soon forget it. Plenty of exercise is always indicated. Drive her if possible.

Fleshy Growth in Teat.

We have a heifer fresh for the first time, that seems to have a fleshy growth in the upper part of one teat. By spreading with a knitting needle a few drops of milk can be induced to come out but that quarter of the udder does not secrete much milk, while a good flow is obtained from the remaining three teats. The teat commences to enlarge rapidly about 2½ inches from the lower

COMMON SENSE Calf Feeder
awarded **Gold Medal** at Pan-American Exposition. **The only Feeder** adopted by experiment stations. It is the kind others try to imitate. Easiest to operate and clean.

Most Durable, Simple, Economical, Scientific and Practical.
Do not be deceived by imitators. Shams are never imitated. **More Common Sense Feeders are in use than all others combined.** Over 50,000 in use. No valves to get clogged or foul. Nipples reinforced and cannot collapse. The calf feeder is a perfect weaner. A substitute for nature.

Extra gain on one calf pays for two feeders.

Best Feeder Made.
Michigan State Board of Health:—I tried every Calf Feeder I could find, but liked yours best.

Worth $10.00.
George S. Bement, Victor, N. Y.:—I am very much pleased with the Feeder and would not be without it for $10. No trouble, no damning, no milk on your clothes, no trouble to teach the calves to take hold of it, no sucking the cows, and the best of all is that when they get about eight weeks old they don't stop for the nipple but just drink out of the pail.

The Principle is Correct.
Purdue University Agricultural Experiment Station of Indiana, LaFayette, Ind.:—We have been using the Feeder to some extent and it is in constant use at this time and we believe it to be very satisfactory in its work. The principle of **Your Feeder,** I believe to be the correct one. C. PLUMB, Director.

Advise Stock Raisers to use it.
Maryland Veterinary Hospital:—I am very much pleased with the Feeder and would advise stock raisers not to be without one.

Price $1.50 including two nipples, sent postpaid for $1.75. We guarantee satisfaction, but if you are in doubt about its value we will send one on approval for 50c to cover postage, remainder to be paid if satisfactory. **Be Sure** and send for our twenty-two reasons why you should use a feeder. It's free. Sold by one dealer in a town.
O. H. MANUFACTURING COMPANY, DEPT. H, LYNDON, VERMONT.

AT $2.25 PER SQUARE
Prices to other points on application. A square means 100 square feet. Write for free Catalogue No. 20.
CHICAGO HOUSE WRECKING CO., W. 35th and Iron Sts., Chicago

end. It does not seem to be inflamed or sore. Can you give us an idea of the cause of the trouble and remedy?

We also have an older cow that has a hard growth at the lower end of the teat which the milk does not pass. That quarter of the udder seems to be well supplied with milk. What is the cause and remedy?

Wis. C. L. A.

ANSWER.

If the growth is within the teat you may lance it with the teat bistoury from the inside and apply Tincture of Iodine over the swelling on the outside. The Iodine may be applied once daily with a brush or feather. The bistoury ought to be sufficient without the Iodine in the other cow.

Milk Fever.

A cow nine years old, has been dry four weeks which time I reduced her feed to 1 qt. bran, 8 qts. shorts mixed night and morning, with all hay, corn fodder and range hay she wanted; (cows run on range all winter.) One week before freshening kept her in pasture and yard so that she would not wander into timber and hide her calf. She dropped calf about on time, in good warm dry shed, and was given water with chill off first day and same feed continued. I milked dry after calf had sucked all wanted both night and morning After 24 hours cow did not eat hay and next feed refused bran, lying down often and walking somewhat unsteady. No passage from bowels during the 24 hours following. At this time I gave one qt. raw linseed oil but saw no effects of same next morning; flow of milk small for her. I thought she was holding for a calf. A high fever for which I gave aconite and belladona. At the end of 36 or 48 hours he was down with limbs straight out and suffering terribly; she soon died. G. A. C.

Citronelle, Ala.

ANSWER.

Your cow had milk fever, and it is quite likely that your dose of aconite thus helped to shorten her life. Aconite must never be given in milk fever as it tends to stop the heart's action which is very tardy in this disease. The only preventive is to keep the cow in moderate flesh before calving and keep the bowels open.

The Schmidt treatment which has been given so often in these columns is a sure cure.

GOMBAULT'S
CAUSTIC BALSAM

A safe, speedy and positive cure for

Curb, Splint, Sweeny, Capped Hock, Strained Tendons, Founder, Wind Puffs, and all lameness from Spavin, Ringbone and other bony tumors. Cures all skin diseases or Parasites, Thrush, Diphtheria. Removes all Bunches from Horses or Cattle.

As a **HUMAN REMEDY** for **Rheumatism, Sprains, Sore Throat,** etc., it is invaluable.

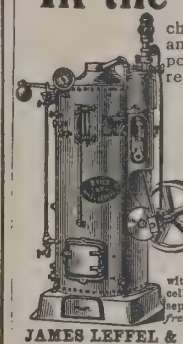
ILLUSTRATION.



GREAT POULTRY BOOK FREE.

On another page of this issue of our paper will be found advertisement of the Cyphers Incubator Co., Buffalo, N. Y. We would not call attention to this matter at this time, but for the fact that these are the people who are responsible for a new era in the publication of incubator and brooder literature. We wish to point out to those of our readers who have seen their annual books and catalogues in the past, that the New Year Book for 1903, entitled "How to Make Money with Poultry and Incubators," now being sent out, is in every way superior to its predecessors.

Nothing has been left undone to make this Poultryman's Guide and Catalogue the most entertaining and instructive work ever published, devoted exclusively to the real business of growing and marketing poultry for profit. "How to Make Money with Poultry and Incubators," consists of 196 pages, is profusely illustrated, giving over 300 photographic views of many of the largest and most successful poultry plants in the United States, England, Germany, New Zealand, and South Africa, and contains twelve special chapters, each written by an expert, treating of profitable poultry-keeping in all branches, as follows: Starting with an Incubator, Handling Chicks in a Brooder, Feeding the Chicks, Duck Producing on a Large Scale, Broiler Raising, Profitable Egg Farming, The Egg and Poultry Combination, Egg and Fruit Farming, Scratching Shed-House Plans, Incubator Cellar and Brooding House Plans, Feeding for Eggs, and Standard Bred Poultry. Everything is made so plain that it can be understood by all. Those of our readers who have never seen a "Cyphers" Annual Guide, and are interested in the latest developments in incubators, brooders, poultry foods and appliances, should write at once to the Cyphers Incubator Company's nearest office, Buffalo, N. Y., Chicago, Ill., Boston, Mass., or New York City, N. Y., and they will send a copy free, postage paid (during next thirty days only), provided you mention this paper.

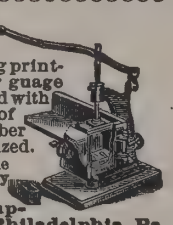
People Buy Butter by the Nose.

They may also taste it, but if it does not smell sweet they are not likely to do so. Your butter may suit the public nose exactly when it leaves your dairy or creamery, but how about it at the end of a week's handling by other parties? Is it not wiser and better for the butter and your reputation to so pack it that neither will be endangered? You can make sure of these points by wrapping every print in a sheet of our

Pioneer Brand Parchment Paper.



It will keep that rancid lot close by from spoiling yours. It keeps out all destructive germs and injurious odors and entirely preserves all the flavor and natural sweetness. It makes fastidious buyers want more of your butter. You see we print your name, name of dairy or creamery or other private trade mark or brand on every sheet. It helps to build a reputation for your butter. Just think these things over and then write us for samples of paper and booklets. **Be sure to ask for our booklet, "Better Butter."** We mail these free.

Cheap Railroad Tickets

From February 15 to April 30 we shall sell tickets to California and the North Pacific Coast, also to many intermediate points such as Helena, Butte, Spokane and Salt Lake City, at greatly reduced rates. Only $33, for instance, from Chicago to California or Puget Sound; $30.50 to Spokane; and from St. Louis and other places in proportion.

This is Your Opportunity

Why should you not go out and see the country? It costs so little and you can easily see what an education it will be for you to take such a trip. The Northwest, in particular, is full of interest. A visit to that country may be the turning point of your life. Send to me for our folder giving full information about how to go, about the trains and rates, and our comfortable tourist sleeping car service.

Burlington Route

P. S. EUSTIS, Passenger Traffic Manager, Chicago, Burlington & Quincy Ry. Co., 705 209 Adams Street, Chicago.

FOR SALE.

A Fine Farm in Sargent Co., North Dakota,

consisting of 7 quarter sections with lease continuing 3 years on two other quarters.

300 Acres in Cultivation, 600 Acres Enclosed in Four Pastures, Remainder Outlying Prairie.

IMPROVEMENTS.

HOUSE is very comfortable dwelling with eight rooms.

FINE BARN 101x112 feet with capacity for stabling sixteen head of horses and eighty-four head of cattle in stanchions. **Calf Stable** for twenty head and stable for young stock and box stalls for hospital purposes.

TWO LARGE SILOS inside with ninety ton capacity each, besides room for two hundred and fifty tons coarse fodder, and **Root Cellar** 24x24 feet.

CREAMERY 22x40 feet, two story with up to date machinery.

FEED MILL AND ELEVATOR 18x32 feet with bins above to hold more than four thousand bushels of grain, equipped with a **Three Roller Mill,** corn sheller, grain cleaner, elevators, spouts and hopper, and bottomed bins for convenient handling of grain. Mill is connected to creamery by a building 20x28 wherein is a

WATER WHEEL that drives the mill and creamery, and **boiler for steam** heating and hot water for use in creamery. This room is also used for carpenter and blacksmith shop. Within this room is also located an

ARTESIAN WELL yielding five hundred gallons of clear soft water per minute under pressure sufficient to drive the mill and creamery. It also provides

WATER IN HOUSE AND BARN and flows off through pastures making several small lakes, furnishing water on four quarter sections and finally flows off to natural water way that leads to Red River of the North.

WATER WHEEL AT BARN furnishes power for cutting ensilage and other purposes. There is also a

GRANARY 18x32 feet with basement now used for

ICE HOUSE The house is enclosed in a **beautiful lawn** of about **eight acres** wherein is the family garden. Several hundred fine forest trees have been planted here besides some fruit trees all of which are doing finely.

This is **one of the finest and most complete** plants for general farm purposes and for stock growing and dairying to be found in the northwest. Practical up to date farmers wanting a fine plant should investigate. For full particulars regarding the farm and its sale address

BYRON PARSONS, Evansville, Ind.

HARDWOOD TIMBER LANDS

from which the older trees have been cut but mostly covered with a fine growth of young timber, located in Marathon County, Central Wisconsin, are now offered for sale by us, on most favorable terms to actual settlers.

This is some of the very best hardwood agricultural land in this state, with a deep, clay loam soil, gently rolling, with water easily obtainable at from 16 to 24 feet.

There is no better land for grain, grasses pastures, oats, peas, fruits or livestock, etc. Particulars will be furnished promptly on application.

RIETBROCK LAND AND LUMBER CO., Athens, Wis.

THE COMING DAIRY COUNTRY

Probably the richest farming country open for settlement to-day on the American continent, is the fine hardwood belt extending along the Minneapolis, St. Paul & Sault Ste. Marie Railway ("Soo" Line) in northern Wisconsin and Michigan. Acknowledged by good authorities on dairying to be the best dairy region in America. A land of Clover and Blue Grass well supplied with streams, lakes, and springs of pure water

W. D. HOARD, Editor of Hoard's Dairyman, says:

"I believe that northern Wisconsin is going to prove the most successful dairy region of the northwest, something like that of St. Lawrence and Lewis counties in New York.

"The peculiar salubrity of the air, the moderate heat of summer, the abundant and pure water, the good soil and luxuriant growth of grasses, all conspire to make it an ideal dairy region."

CHOICE LANDS AT LOW PRICES.

If you want a home in the "Great Clover Belt" write for free illustrated folder to **D. W. CASSEDAY, Land Agent "Soo" Line, Minneapolis, Minn.**

A Virginia Letter and Queries.

ED. HOARD'S DAIRYMAN:—Our cows have been doing very well this winter, but would like to make them do better. We have 29 cows, 7 are heifers with first calf, 2 are culls and will go to market soon. They have averaged nearly 20 lbs. butter a day this year. We also have 9 heifers that will freshen during the year. We are feeding corn stover and pea hay for roughage, 20 big ears of corn (about 10 lbs. grain) to each animal a day, and ground feed consisting of 3 parts Vim oat feed, 1 part cotton seed meal, varying from 1 lb. to 7 lbs. according to the milking qualities.

Owing to an unfavorable season we had to buy nearly all of our feed, which was very high, corn costing $2.50 per bbl., delivered. We paid $4.50 for enough to feed the cows, heifers, etc. Feeding it in the shuck, there is very little labor, and the hogs that have lived on the manure pile and skimmed milk will sell for about $300 in April, which will pay a good part of the feed bill, which is not the case where ground feed is used exclusively.

We have been cutting and shredding the stover with a two-horse sweep power, but it is so hard on the horses when the weather is bad, that we have decided to get a gasoline engine, which can water the cows and do other little jobs.

We tried a silo many years ago, but abandoned it, owing to the cost of filling, etc., but there is so much written about them now, that it looks as if we will have to give it another trial.

It is almost impossible to get extra help here in summer.

What kind of a ration would corn silage and cow pea hay make, without any grain? We would use the Albemarle Prolific corn, which Mr. Meroney describes on page 1106, which ears very freely. We are preparing to put 40 acres in corn and 40 acres in cow peas. If the weather is at all favorable, that will give us all the peas the cows will eat once a day, and some for the horses and hogs, and about one-half of the corn and stover that we will need. Mr. Meroney claims excellent results from silage alone, made of corn and peas, but he can graze rye or grass all winter, while our cows stay in the stable all winter, except long enough every day for them to drink and the stables cleaned.

I notice in the DAIRYMAN that the analysis of cow pea silage is little higher in protein than corn. There is always a drop, of at least one-tenth in the flow of milk when we stop feeding pea hay, and the loss of butter is greater.

Would the hogs get any good from the droppings from the cows if fed on corn silage and pea hay?

What would be required to make a balanced ration for a 900-lb. cow giving 30 lbs. of 5 per cent milk, in addition to the silage and hay?

What size silo, round or square, will it take to hold 168 tons? I figure 40 lbs. a day for 40 head, 210 days.

How much land will be required to grow the corn, using the Albemarle Prolific variety, which yields ⅓ or more forage than ordinary field corn? The ordinary corn averages about 9 feet in height here.

How do you test cream with Babcock milk tester? The bottles are scaled to 10 per cent.

How soon after calving is a cow's milk good for butter? B. B. T. & SON.

Broadrun, Va.

Notwithstanding the very favorable reports which have been made from time to time by Mr. Meroney and others in regard to feeding a combined silage, we are disposed to think that under ordinary circumstances it is profitable to feed at least some grain in connection with silage of any description, or alfalfa hay. It is true that the cow has very capacious stomachs and a very large digestive capacity, but notwithstanding this it is hardly practicable to expect a cow to be able to consume and digest enough coarse fodder to furnish the material required to make liberal quantities of milk. When grain feed of various kinds is very dear it may be a question whether the extra amount of milk secured by feeding grain will yield a profit. Considerations of this character emphasize the necessity for deeping a daily record of what each cow does—in short, whether she is a profitable milker or not. Like our correspondent we are very much surprised at the very low content of feeding credited to cow pea silage. We think there must be some mistake about this, as the results are out of all comparison with the figures given in the analyses.

We are of the opinion that swine would find very poor picking following cows fed on silage and it is very questionable whether on the whole it is not more profitable to grind corn, especially when it is high in price, than it is to feed it whole and depend on swine to collect and utilize the unground kernels and undigested meal after passing through the cows.

In this part of the country we should expect 40 acres of corn and 40 acres of cow peas to furnish a good deal more roughage than forty cows could consume.

A silo to hold 168 tons may be 18 feet in diameter and 32 feet deep, or 19 feet in diameter and 30 feet deep, or 20 feet in diameter and 28 feet deep.

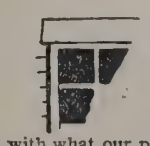
For testing cream in the ordinary milk bottles divide the sample into three approximately equal parts and add as much water as cream and proceed as for testing milk, using three test bottles and combining the readings to ascertain the full amount of test for the cream.

Milk may frequently be used for butter making the fourth day after the cow freshens, but the better plan is to wait until the sixth day.

Spelz and Bromus Inermis.

A reader at Utica, Ill., asks where he can find a feeding analysis of spelz and bromus inermis, and whether they will do well in Illinois.

There is not to our knoweledge any satisfactory analysis of either spelz or bromus inermis. At all events they have not yet found a place in the general feeding tables as published. Spelz has been analyzed in Minnesota and seems to carry about the same feeding value as oats, but neither spelz nor bromus have passed the trial stage in this country. We would not advise this inquirer to do more than try these things in a very small way, and thus find out for himself whether they are adapted to his soil and climate.



We are more disposed to tender this advice in the present case from the fact

ONE STEP MORE

Will be fatal to the sleep-walker. Will he draw back or will he take the final, fatal step? A great many people are in peril like the sleep-walker. They are diseased. The disease is progressing day by day. The time comes when one more step away from health is fatal. The man who has suffered from indigestion or gastric trouble goes some night to a dinner and returns home to find he has taken that last step from health which can never be taken back.

To neglect the cure of indigestion or some other form of stomach trouble is dangerous. It is also inexcusable. Dr. Pierce's Golden Medical Discovery cures diseases of the stomach and other organs of digestion and nutrition. It purifies the blood, stimulates the liver, cures biliousness, and eliminates bilious poisons from the system.

"The praise I would like to give your 'Golden Medical Discovery' I cannot utter in words or describe with pen," writes Jas B. Ambrose, Esq., of 1205 ½ Mifflin St., Huntingdon, Pa. "I was taken with what our physicians said was indigestion. I doctored with the best around here and found no relief. I wrote you, and you advised me to use Dr. Pierce's Golden Medical Discovery. I took three bottles and I felt so good that I stopped—being cured. I have no symptoms of gastric trouble or indigestion now."

If you ask your dealer for "Golden Medical Discovery" because you have confidence in its cures, do not allow yourself to be switched off to a medicine claimed to be "just as good," but which you did not ask for and of which you know nothing.

You can get the People's Common Sense Medical Adviser, 1008 pages, paper covers, *free* by sending 21 one-cent stamps, to pay expense of mailing *only*. Address Dr. R. V. Pierce, Buffalo, N. Y.

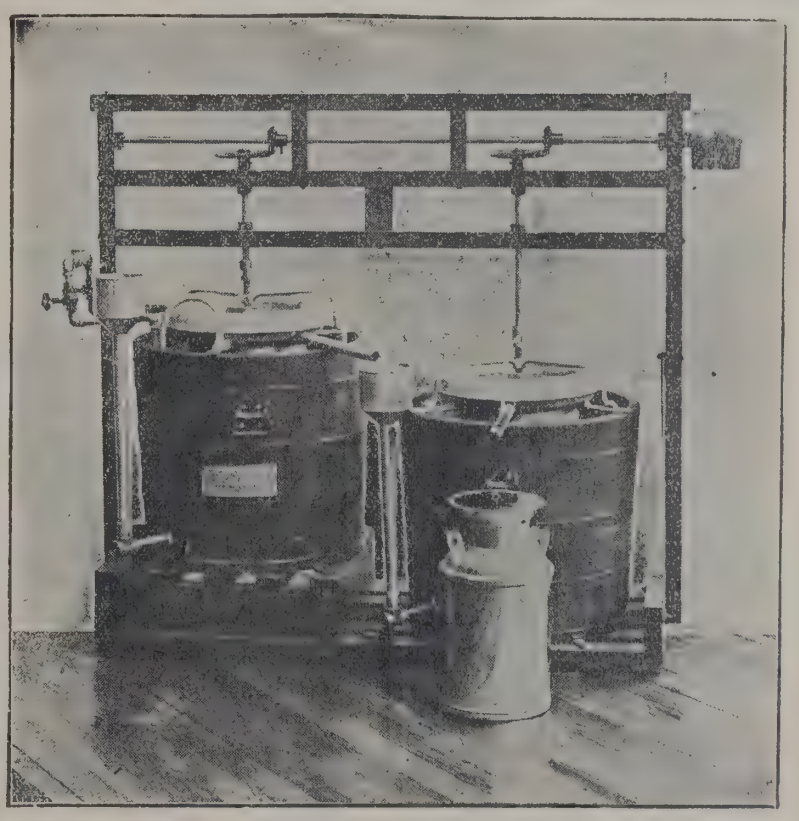
Salzer's Alfalfa or Lucerne.

Glory enough! Ring the bells! Shout for joy! The year of jubilee has come! How's that! Why, sir, it has been made possible to grow Salzer's Alfalfa Clover in every state in the Union, North, South, East or West—why, sir, cold Minnesota, and freezing Wisconsin, and treeless Nebraska, and the prairies of Illinois and Iowa, and the bottoms of Indiana, and the pineless soil of Michigan, and the rich farms of New York and Pennsylvania—yes, every state can grow from two to four crops of Alfalfa, if **Salzer's Northern Grown Alfalfa** seed is used! That's acclimated, that's hardy, that's tough, and we believe tougher and better than the Turkestan Alfalfa!

It's a Wonderful Clover.

It's the greatest clover on earth, it's extremely early, the first crop cut in May, the second prodigal yield in July, the third in August, and lots and lots of pasture besides. It's great as a fertilizer, sending 10 to 25 feet after moisture and nourishment. It withstands drouth, wet, indeed, when once established it defies all elements, returning yields that will gladden the heart and fill the purse of every farmer growing same.

Look at This Testimonial.



Carl G. Kleinstueck, Saxonia Farm, Mich., has this to say: "I have a patch of Salzer's Alfalfa Clover that I seeded 13 years ago, which yielded four big crops last year, besides good fall pasture. It has been cut three times already this season, and the fourth crop is about six inches high today, and will be ready for mowing in about three weeks."

We have hundreds like it coming from all parts of the United States. It will pay you, Mr. Farmer, to give Salzer's Alfalfa a trial.

For 6 Cents.

If you will mention HOARD'S DAIRYMAN when you write, enclosing 6 cents in stamps, we will mail you a sample package of **Salzer's Northern Grown Alfalfa Clover Seed**, as also our catalogue that contains the full description of how to grow with success this wonderously luxuriant hay and grass producing plant. Send today 6 cents in stamps for above and be sure to mention HOARD'S DAIRYMAN.

JOHN A. SALZER SEED CO., La Crosse, Wis.

KALAMAZOO STOVE COMPANY, MFRS., KALAMAZOO, MICH.

All our Cook Stoves and Ranges have patent oven thermometers.

that the inquirer reports milking 15 cows and making 110 pounds of butter per week, with some of the cows in milk all last summer. He is feeding 50 lbs. of silage, 4½ to 5 lbs. of bran and 3 lbs. of gluten to each cow per day, and weighing the milk. Where one is doing as well as this, we no not consider it advisable to inaugurate any radical changes either in the cows or crops.

CONCERNING OUR ADVERTISERS.

All of our readers who are interested in dairy stock are aware that owners of good cows sustain heavy losses each year from milk fever. This disease attacks the best cows in the herd. Hood Farm Milk Fever Cure is proving quite successful. We have been furnished a copy of the following letter from General Lawrence's farm superintendant at Medford, Mass., and we take pleasure in publishing it for the benefit of cattle owners:

"I recently had a very severe case of milk fever but the cow came out all right. This is the first cow taken with milk fever, that we have been able to save. We have lost three in the last twelve years out of a small herd. We have had what we call good veterinary service, and think we have given good care.

"This last cow was taken after she commenced to calve. All action stopped and the calf died. I administered Hood Farm Milk Fever Cure as directed, and in about seven hours the cow began to brighten up a little. She improved very slowly each hour, and at the tenth hour we took the calf away. The cow had then gained strength to assist. The next morning she got up on her feet, but was quite shaky. The improvement was gradual but sure from that time on.

"We used no other medicine in this case but one large dose of the Hood Farm Milk Fever Cure. I think enough of this remedy not to allow a cow to calve in our stable without having some on hand for early use, for in some cases you haven't much time to wait for remedies." C. L. BLAKELY, 343 Winthrop St, Medford, Mass.

THE LYON MANUFACTURING CO., Brooklyn, N. Y. GENTLEMEN:—It seems to me that among your testimonials to the efficacy of Mexican Mustang Liniment you hardly give enough prominence to its wonderful curative power on inflamed and caked udder in cows. I have used it for two years in my stable, and since I began its use have not had a case which was not relieved by a few applications. A thorough bathing of the udder with hot water, followed by gentle and persistent rubbing in of the "Mustang," will, I believe, cure any case, leaving the teats in good order—unless suppuration has already begun. If others in the dairy business knew this it would save much worry and loss. Respectfully

Columbus, Ga. MRS. A. I. YOUNG.

Though good seeds are scarce this spring, we feel assured that any of our readers applying to that old reliable seed house, Johnson & Stokes, Philadelphia, will be well taken care of. Even if seeds are bought elsewhere it would be well to write for their Garden and Farm Manual and see what development is reached by different varieties of vegetables and fruits from the photographs therein reproduced. The book is illustrated throughout by reproducing photographs of seed products. This firm takes a good deal of pride, and at the same time serves its own interests, in living so scrupulously up to its old time reputation for supplying only the best to be secured in the seed line. This manual suggests superiority in its every page. There is no better place to get a true estimate of the novelties. Whatever is of real worth is sure to be found with this firm, and by illustration from photograph and accurate description, you know exactly before ordering just what its merits are. The book is mailed free. Consult their new advertisement appearing in this issue for correct address before writing.

THE CHIEF CONSTRUCTIVE FORCE IN AGRICULTURE.

Two generations ago our grandfathers harvested their wheat and oat crops with the McCormick reaper, and little did they dream that the crude machine they used would be the forerunner of such marvelous advancement in the methods of harvesting grain as has been developed within recent years. Today more than two and one-half million agriculturists harvest their crops with McCormick machines. Since 1831, the year in which the first successful reaper was constructed in a blacksmith shop at Steele's Tavern, Va., the McCormick has been one of the chief constructive forces in developing the agricultural resources of the world. For more than three score years the McCormick has represented the highest attainment in the manufacture of harvesting machines, and this name has become a household word throughout the world. "A Model Machine" is the title of a new book which has just come from the press. It is an interesting publication and should be in the hands of everyone who needs or operates a harvesting machine. When writing please mention HOARD'S DAIRYMAN, and ask for a 1903 McCormick Calendar, if you have not received one, which will be sent, together with the book without charge. Address the nearest McCormick agent.

WOOD PRESERVATIVES.

Decay is the greatest enemy to silos, and dairymen and farmers will do well to look carefully into the merits of well known wood preservatives. It is not too much to say that the life of a silo can be doubled by treating the wood work thoroughly with a scientifically made preservative. Paint will not fill the bill, because it will not penetrate the wood, but a bona fide preservative will sink into the pores and tan the albuminous parts of the wood so that it will resist decay for a long time. These preservatives can be had at moderate prices, and the cost of treating a silo of ordinary size is so small that the profit to the owner is very large. All the other woodwork on the place can be treated in the same way with great advantage. See add of Samuel Cabot, Boston, Mass., this issue.

It is a great satisfaction to us to call the attention of our readers to the ad. of Ross Brothers, the well known seed and implement house of Worcester, Mass., which appears elsewhere in this issue of our paper. To hundreds of our readers this firm needs no introduction. To those who are not so fully acquainted with them we are pleased to state that they have been established for many years, and have built up a large business, due undoubtedly to the splendid line of goods they handle, and their honorable and fair methods. They issue a very complete catalogue—in fact, it would be difficult to think of anything the modern business farmer requires which cannot be supplied by this firm. Write for one of their catalogues to-day, and mention this paper.

Moldy Bread Poisonous for Cattle.

A gang of Italian laborers were working on the Chicago & Northwestern R'y., near Appleton, Wis., recently, and they threw some pieces of moldy bread over the fence to a cow, which ate it at once. In a short time the cow died in the convulsions of gastritis. The farmer owning the cow brought suit against the railroad company for the value of the animal and recovered $40, it being shown that the moldy bread was a poison to the bovine species. We believe there is some truth in this matter. A few years since, the senior editor lost a very valuable cow and young bull from gastritis, both of whom had been fed the waste scraps from the family table in which was included several pieces of moldy bread. Moldy ensilage, and especially moldy bran, is quite apt to produce serious stomach derangement in cows.

Your Dairy

May be kept ever so clean, your cattle may be pedigree stock and you may feed them in the most approved manner, but your patrons will never suspect these things if you deliver milk from a ramshackle wagon. An attractive milk wagon attracts trade; it's not a luxury, but a practical necessity.

The Koenig & Luhrs wagons are built for the business. They embody every convenience, are handsome in finish and general appearance, are made of good materials and are so well put together that they'll last for years. A quarter of a century's practical experience has taught us the "know how" of good wagon building. Are you considering a new wagon? It will pay you to get our catalog and prices before placing your order.

The great blood purifier, Zaegel's Swedish Essence of Life is to be given away free to readers of this paper.

This remarkable medicine by *removing disease germs from the blood* has an action that effects the entire system. It tones up the stomach and creates an appetite; works on the liver and has a mild, continuous effect upon the bowels thus cleaning out the entire system; it makes new rich blood, regulates the heart and kidneys and rids the body of all waste matter. It also induces a gentle perspiration, thus preventing fevers and congestion. Rheumatism, backache and headache, biliousness and all nervous diseases are rapidly cured, as well as diseases peculiar to women. No one need trouble themselves to doubt whether this remedy will do all these things, for you can have a free trial package first and see what it does for you.

Do not neglect to get in your application at once. The best way is to sit down this minute, write a letter to M. R. Zaegel & Co., P. O. Box 989, Sheboygan, Wis., and say that you want a trial package of Swedish Essence of Life. This will be sent you by mail and is large enough to convince you of the merit of this celebrated household remedy. A 2-cent stamp should be enclosed in your letter to pay the postage on this free sample. Write for it to-day.

The Result of our Pig Feeding Experiment.

ED. HOARD'S DAIRYMAN:—We wrote you last November about our pig family and promised to give the result in detail. We have never been an advocate of feeding pigs for profit on purchased grain, and we attribute our little margin of profit at this time, partly to the abnormally high price of pork.

We placed 25 pigs in our new hog house last November that were between seven and eight weeks old. Inventoried them at $48, ($2.00 each; one lame one thrown in). That was the best offer we could get. As we could not afford to produce pigs to that age for the price, we must resort to another expedient; hence the experiment with following result. They were grade Chester Whites and were all thrifty; all fed in one pen; no sickness or loss. We fed them wheat middlings at $1.00 per hundred weight and milk, at 12 cents per hundred, purchased at creamery. We inventoried cut beets at 20 cents per bushel basket, and cull corn 25 cents, about what they were worth to feed the dairy.

1,000 lbs. wheat middlings at $1.00 per cwt	$10.00
600 lbs. ground rye at $1.00 per cwt.....	6.00
70 bushels ear corn at 25 cents.....	17.50
1,500 lbs. skim milk at 12 cents per cwt.....	1.80
5 bushels cut beets at 20 cents.....	1.00
	$36.30
Inventory 25 pigs.....	48.00
Total cost to February 1.....	$84.30
12 pigs sold, weighed 1,020 lbs. at 6 cents..	$61.20
13 pigs in pen, weighed 1,040 lbs.....	62.40
Total.....	$123.60
Deduct total cost.....	$84.30
	$39.30
Two stock pigs were fed in same pen, and as the cost of feed was about $1.35 each, we charge them $2.70 for feed, leaves our margin for feeding.....	2.70
	$42.00

They were placed in the pen November 12, so were fed about 80 days. Neighbor Brown, who has been quite an extensive feeder of pigs, tells us that pigs fed as they were should have weighed more at that age, but the scales don't say so. We have a pile of manure that is well worth the bedding used, and we can't count the time much as it took no more trips to the piggery to feed 27 pigs than it would to have fed seven, and we are "out of woods" in much better shape than had we sold them as weanlings.

Whether it will pay to feed the remaining 13 longer is a question to be determined. Four years ago we bought 15 of the same quality of pigs that averaged 100 lbs. in weight for three and one-half (3½) cents per lb., delivered to the pen, and we paid the same price for middlings to feed them, $1.00 per cwt. That is why we say the high price of pork has helped us out. Perhaps some one else could have done better, but these figures are facts and we are satisfied, but don't care to make pig feeding a specialty.

New York. FRANK SHELDON.

The Cost of Ignorance.

At a recent meeting of the Ohio State Farmers' Institute, Mr. L. P. Bailey, of Tacoma, gave an address on "The Condition and Needs of the Dairy Industry in Ohio." Mr. Bailey did not mince matters any. He said that in 1850 Ohio stood second in rank as a dairy state; now it has sunk to the sixth rank. He claimed that the Ohio farmer had stood still; had not cared to give himself the education and knowledge that the farmers of Wisconsin, Iowa and Illinois were reaching out for, and he gave this pat illustration of the tremendous cost of such contented ignorance.

There are some ten renovated butter factories in Ohio that pay the farmers 8 to 10c per lb. for their butter (?) and try to made it fit to use on the old landlady's principle, "If you'd seen what I took out o' that butter you'd call it pretty clean!" The margin between the 10c per pound paid for this low grade stuff and the 23½c per lb., the average Elgin price for 1902, was the vast premium paid by farmers for ignorance and carelessness, a total of some $325,000 for Ohio alone last year.

That was a good illustration, for the butter the renovated factory buys, is the butter of costly, wasteful ignorance every time. Such farmers would groan in spirit at the idea of paying a dollar a year for a paper like HOARD'S DAIRYMAN, that would show them a better way, but they will willingly lose fifty dollars a year on the butter of ignorance, and feel perfectly contented.

115-117 St. Clair St., Toledo, Ohio.

This Is to Tell Those Who Read It Why

Windmill Prices Must Go Up

Twenty years ago a 12-ft. wheel cost $160.00, and but few bought them. It was a prohibitive price which the invention of the steel wheel has made forever impossible.

When the Aermotor Company came into the field with the first 8-ft. steel wheel, which did the same work for $40.00, it "took the country." Later the price was reduced (without competition) to $25.00 and the downfall of the Aermotor Company and the ruin of the windmill business was freely predicted. But the result proved otherwise. The price at that time was enough. Iron and steel were low, labor was plentiful and cheap, and the man at the helm of the company foresaw that, for a few years at least, the cost of production would be less than it ever had been or would probably ever be again. It was his opportunity and he grasped it.

The Aermotor went everywhere. Where one went others followed rapidly, and the business soon reached immense proportions. By foreseeing the advance that came with prosperous times, and purchasing large quantities of material before prices advanced, the company has been able to continue the same abnormally low prices for three years in the face of a market that has doubled the cost of material and added a large percentage to the cost of labor. It did this in the hope that iron and steel would come down, but they have not and there is no prospect that they will. On the other hand, the cost of material and labor is constantly increasing. How far this may go no one can predict. To meet present conditions, a small advance in prices has become necessary. This advance does not nearly represent the increased cost of production, and it is quite probable that increasing cost of material may make further advances necessary.

THIS IS THE TIME TO BUY

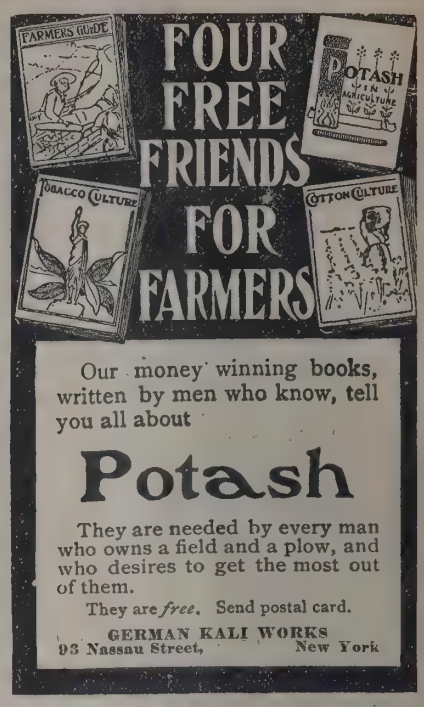
If you expect to need a windmill this year, now is the time to buy. Prices may soon go higher. They certainly will not be lower. Money put into a windmill now will be well invested. Many dealers bought a stock of Aermotors before the recent small advance and will be able to sell now for lower prices than later. If you buy now you will be sure to have your windmill up and ready when you need it. Windmill men are not so busy now as they will be later. You may be disappointed if you put the matter off. You will not miss it if you buy now.

IT IS IMPORTANT THAT YOU BUY RIGHT

Buying a windmill is an important matter. You will have to live with it a good many years. It will either lessen your burdens or add to them. Water is needed every day of the year. The Aermotor was made to pump it for you. It has never failed to carry out the purpose of its creator. The first Aermotor distinguished itself by running when all other mills stood still. Each one of the succeeding hundreds of thousands of Aermotors has done the same. The reason for this is simple enough. The Aermotor was the result of design, not accident. It was made for a purpose, and that purpose was well understood in the beginning. Every requirement was carefully determined in advance. Every strain was accurately estimated. Every pound of material was arranged to the best advantage. Simplicity was added to strength. Each object to be accomplished was aimed at directly. There were no unnecessary parts, no wasted material, no stupid devices.

An Aermotor once properly erected, requires no adjusting or tinkering. This is the result, not only of perfect design, but of proper construction. The best material for each part has been carefully determined, and only the best is used. Much of the material in the Aermotors is specially made for that particular purpose. The very stiff sheet steel used in the sails is made only for the Aermotor Company. Even the Babbitt metal used in the bearings is specially made to meet the peculiar requirements for a windmill.

THE AERMOTOR COMPANY KNOWS WHAT IS BEST IN A WINDMILL



It is not a difficult matter to make a windmill. They have been made for centuries. It is, however, a difficult matter to make the best that can be made. To do that requires peculiar skill and ingenuity. The Aermotor Company, alone, has shown remarkable originality or genius in the business, It has had more experience than all others combined in making steel windmills. Isn't it fair to conclude that it knows what is best in a windmill? The best costs no more than an inferior imitation. If you buy anything less than the best you do not get the most for your money.

But the best may be a dismal failure if poorly erected. The erector must know how to plan the job, get the parts together properly, and detect the least thing wrong with its working. Aermotor dealers know how. They are selected for that reason. Most of them have been handling the Aermotor from the beginning. They are men of trained judgment and mechanical ability. To get the best out of the best mill, one of them should erect it for you.

WRITE FOR OUR WINDMILL BOOK

We have a book that tells all about windmills. It begins with the Dutch wind mills of 1400 and ends with the Aermotor of 1903. It contains 125 pictures to show you what windmills should do and what they should be. It tells all that invention has done for them. When you read this book you will know all that anyone knows about windmills. You will know the right kind from the wrong kind and know all the differences. To avoid a mistake don't buy without reading it. The book is free. Simply write for it.

FARMER BRIGHTON, FAIRFIELD, IOWA.

A Washington Herd Report.

ED. HOARD'S DAIRYMAN:—We send you our yearly report of the Elmwood Herd of A. J. C. C. Jerseys as shown by our monthly creamery statements, beginning Sept. 1st 1901, and ending Aug. 31st 1902. Pounds of milk, 82,574; pounds of butter, 5,132; cash earned $1,155.89; number of cows 13, six of which were heifers with first calves; average per cow, pounds milk 6,352; pounds butter, 394.7; cash earned, $88.91. The leading two-year-old heifer, Golden Glow 2d 148165, by Golden Grand 53658, out of Golden Glow 129238, imported, was 2 years old Sept. 18th 1901. Freshened Sept. 6th, began saving her milk Sept 10th, from which date to June 25, 1902, she gave 6,067 lbs. 3 oz. milk; her milk tested 6 per cent fat in Sept., was not tested again until May 14 and 15, 1902. A sample of four milkings was taken in which she gave 41 lbs. 7 oz. milk, duplicate tests of which showed 7.3 per cent fat. During the month of May she gave 638 lbs. 7 oz. milk. Again on June 13 and 14 a sample of four milkings were taken in which she gave 36 lbs. 6 oz. milk, duplicate tests of which were made showing 7.4 per cent fat. For the 20 days in June she gave 342 lbs. milk and on July 25, she produced a fine calf at full time; she is a typical Golden Lad heifer, inbred to him. Now that you may see that we are getting good value for our skim milk which is fed to hogs, part to calves and chickens and perhaps the chickens pay as much per 100 lbs. for it as either the hogs or calves. Dec. 10, 1901, we sold seven, 10-months-old pigs that weighed 2400 pounds, average 343lbs. at 5½ cents per pound, $132; butchered four pigs, 1000 lbs. at 5½ cents equals $55; sold one at $12, total $199.

Again on Sept. 10, 1902, we sold fifteen 9-months old pigs, weight, 4,028 lbs. at 6¼ cents equals $251.75; butchered 4 pigs 1100 lbs. at 6¼ cents equals $68.75, total $320.75; for this last lot of 19 pigs we fed $133.22 worth of shorts, the balance was made on skim milk and clover. We keep two brood sows and one boar and raise the pigs. We raised twelve calves, two of which we took from a neighbor who was going to knock them in the head, and raised them; made veal of them; sold one for $16 which weighed 200 lbs. at 8 cents; other one for $19 95 which weighed 249 lbs. at 8 cents; pretty good for grade Jersey skim milk calves. At present we have 12 pigs that weigh 200 each, feeding them ground wheat, clover hay and skim milk. We raise two litters of pigs a year.

You can see we have learned quite a few things in reading HOARD'S DAIRYMAN for the past 10 years. Among the things learned was if I expected to get profit in dairying I must keep dairy cows and utilize the skim milk and not board an unprofitable cow and not to expect profit from a general-purpose cow renamed "Dual-purpose." I tried to breed a dual-purpose cow; she was my old time ideal. I bred to the so-called milking strain Short-horn bulls until I had 15-16 Short-horn blood, and the more Short-horn blood I got the better beef cows I produced, but it was at the expense of dairy products

Washington. A. M. STEVENS.

Important Notice to Farmers Concerning Oat Smut.

All Wisconsin farmers have without doubt noticed smutted heads of oats in their fields from time to time, but probably few of them realized the enormous loss due to this fungus pest. The Experiment Station at Madison has been carefully investigating the subject for several years past and last season it studied smut in oat fields in a large number of counties in the state. From these studies it estimates that the loss to the oat crop for the whole state amounts to 17 per cent,—that is, our farmers might have had 17 bushels more of oats for every hundred that they actually secured. The Station estimates that the total loss due to oat smut last season was at least five million dollars. It was found during these visits to farms that many oat raisers thought they had little or no smut in their crop, yet when it was carefully examined losses were found ranging from five to thirty-five per cent. A perfect remedy for oat smut is announced by the Experiment Station, which tells us that the chemical used costs but one cent for each bushel of seed oats treated. Our farmer readers wishing to know in full of the treatment for oat smut, should send a postal card to Agricultural Experiment Station, Madison, Wis., asking for a copy of Bulletin 98, which gives full directions for treating seed oats to prevent smut.

CLIP YOUR HORSES
with 20th Century Clipper PRICE ONLY **$5**

They feel better, look better, work better, and are less liable to catch cold. Don't let your horses stand in the barn all night with a heavy damp coat of hair on. It weakens them and they lose flesh. If clipped they dry out quickly, gain flesh and can be groomed in one fourth the time. Weighs only 15 lbs. Clips a horse in 30 minutes. Send for Catalogue H

Building a Silo.

Ed. Hoard's Dairyman—Will you permit me to answer the following letter through the Dairyman?

Having read your article in Hoard's Dairyman on the round silo, I thought would like to have a few more particulars if you would be kind enough to give them to me. I want to put up a silo for next winter, as I find I cannot grow sufficient roots to keep up the flow of milk through the winter. Have any amount of hemlock on the farm, so am getting some logs cut 20 feet long. To make a silo the same size as yours, I should require 16 pieces 2x6 and three pieces 6x6; is that right? How deep have you got your foundation? Would brick do as well as stone? In making holes for the iron bands to go through the 6x6, do you make holes in the center of the extra four inches you have to spare, or make them so that the iron band will come close to the staves? Also, how do you get the iron bands shaped to fit tight against the staves? To complete the band right round the silo after you have the first half on, what distance do you allow in the post at the back for the second half to start from? About how many acres of corn did it take to fill yours last year? Is is necessary to have the staves planed on all sides or do you think it possible to use them just as they are sawed? Should they be cut any length of time to dry before putting up, or put up when sawed? A. E. G.

Rockville, N. B.

I will gladly answer Mr. G——'s questions as far as I am able. In the first place, will say that he will find no better timber than his hemlock, if it is sound. The circumference of my silo is 40.84 feet, taking out the space occupied by the door, door posts and middle post, five feet, and we have 35.84 ft. to be filled by the staves. As these staves are but six inches wide, it will require seventy-one of them, or if he desires to make the silo a trifle larger, seventy-two; this together with the three posts and the two pieces of 4x6, framed between the doors, will constitute all the lumber required, which will be practically, 1525.60 feet, and to this we may add about fifty feet, for the double boarding for the doors.

In my previous article I should have said that these door posts have grooves cut in the inside corners, two inches each way, in which the boards making the door ean be placed, and brought just flush with inside of silo. My foundation is eight inches deep.

If I did not have the stone, I would prefer cement rather than brick, and cement can be made into a grout by mixing with small, or broken stone quite cheaply. It need not be laid more than four inches deep if placed upon a good, solid, smooth foundation, that will not be acted upon by frost. It will be impervious to water, while brick being quite porous, is not so.

In making holes for the hoops through the posts, care is taken to have the inside of the holes just two inches from inside edge of posts so that the hoops will come close to the staves. They are bored a little angling, coming, on side of posts where nuts are to be applied, at about the middle, or three inches from each edge. These holes were bored in the posts before they were placed in position. Using one-half inch iron for the hoops, we found no difficulty in shaping them to the silo. Mr. G. may have them shaped in the tire roller at his blacksmith shop, if he desires to do so.

If seventy-two staves are used, one post at the back of silo will be exactly in the middle of the circumference, making the hoops of equal length on both sides. They should be cut so that they may be 19, 18 feet in the clear, or between washers, when the nuts are turned down.

Our staves are not planed, or beveled at the edges, with the exception of the two standing next the door posts, which are beveled to fit fairly against the posts. I see no advantage in planing, or beveling the edges of staves, except to improve the looks of the silo. Ours keeps the silage perfectly and stands well through the summer.

There is no particular need of letting the lumber dry any length of time before putting it up, still if the staves are dried out some, they will handle easier. If the lumber is quite dry, it will only be necessary to bring the hoops sufficiently tight to get a good tension; if it is green, they should be turned up as tight as can be done with safety. If lumber is allowed to dry, care should be taken to stick it up perfectly true, and weight it so that it will not warp or twist.

Another essential feature of our silo was omitted from my former article. After everything is completed, a rim of cement about 4 inches high was laid against the bottom of staves on the inside, and allowed to extend out about 6 inches on the bottom, and this makes the bottom somewhat kettle shaped and insures an air tight joint between the foundation and the ends of staves and posts. Our silo was filled with the stover of sweet corn after the ears had been removed for fodder. It will hold fifty tons of silage, and we have filled it from five acres of this stover. We have grown Sanford corn for our square silo, securing the same amount from about three and one-half acres, using the entire plant for silage. B. Walker McKeen.

Maine.

Schwertfeger is "Mad" and Threatens.

Mister Hoard, Eshquire:—Wat you mean anyway py sending me two of your babers—und one of dem marked mit a plue bencil? Oh ho! you want to insult me— you do? Wat for you make a ring around und a tick line under dem words wat Mr. Howard wrote way from New York on bage 65, "We respectfully request 'Double U Dee' not to bother his head *with the man who don't want to learn*," und den send *it to me*? Do you want to make belief dat Mr. Howard he mean *me*, heh?

Mr. Howard he didn't mean me a tall; because I was shure he is a shmart man; und one shmart man he always can dell anodder mitout seeing him!

But you are so mad dat my letter got in de baber wen you was gone away sout, und dat odders now don't pelief no more dat you got de best kows—you chust don't know wat to do mit yourself! Und you pean chust watching for a chantce to git efen mit me efer since—yessir, dat's wat you are!

Und anodder ting I want to say to you—you got to discharge dat man wat sets up de dipe! He shpoiled my shpelling de last time und I was awfully ashamed wen I seen it, because some of dem readers might not know how it was und tink I can't write no petter! You discharge him und hire some one else. Oh, say, *I got a poy*—he's a shmart one, chust like his pa—may be you gif him a drial? He ain't none of "dem wat don't want to learn." He does all de correcting of my shpelling—watefer little may pe needed—und my frients say it's gitting petter all de time. Don't you tink so doo? Hain't my shpelling petter dan in my last letter? Yessir I tink so. He's going to the high-school now, but he can shtop any time you want him—he knows a good deal now already.

But now I said so much—I'm going to say some more, because may be after all some of de beoples might tink I don't know so much as you. May pe dey tink I got only dat one cow—say wat for call her a "Cherman Kow," anyway! I didn't say she was a Cherman cow—und she ain't! I got her from an Irishman und he got her from a blue—I mean true blue—Yankee. Und I found out she's got a fine bedigree. Her mudder's mudder, only, was a parnyard cow, but my cow's fourfodders was all numbered stock. (My poy says dat ain't de right word for it, I should say register; may pe he's right but I dasn't gife him right efery time, or he'll tink he knows it all.) Yessir she is a fine cow—as goot und I tink petter dan any wat you got! Und I got four more wat is nearly as good—wat you tink of dat, eh?

Und you ought to pe ashamed of yourself anyway—trying to make odder beople pelief I am one of dem kind wat don't wan't to learn! You know it chust as well as I dat wen I puilt my new parn last summer, and silo, I made it chust exactly like your own—only different und a good deal petter. I got more windows und more light in it as you got, und as my wife lets in her barler—because she's afraid de carpets will tan—und I got more fentilators all ofer in de walls and on de top; und witewash all ofer:—Shaw, wat you talking apout anyway! It only makes me mad when I tink of it, because you know it well enough I'm one of dem egressive farmers (dare goes dat poy again—he says dat is de wrong word—und I don't care, you know wat I mean, und if it hurts your feelings I'm glad of it!) You're only chellous, dat's wat is!

But you petter not fool mit *me*! Because if you make me any worser mad I'll chust bublish de record wat my cows got at de creamery last year, und it'll knock yours in a cocked hat!

August Friederich Wilhelm Schwertfeger.

Jefferson, Wis.,

Conditions in Cattaraugus County, New York.

Ed. Hoard's Dairyman:—Enclosed find my renewal for Dairyman, as we find so much matter of great importance to cow keepers in it. I cannot see why dairymen don't everyone of them have it. Every number is worth the price of subscription to us; would that I could have sent along some new subscribers, but when I ask a farmer if he takes Hoard's Dairyman he looks at me with a blank stare. Upon being pressed for reasons answers: "times are pretty good, don't think I need any advice about running my dairy; seem to get along as well as any one in the dairy business."

Now as to the dairy business in this section. There are about 12.000 cows within a radius of 10 miles of Ellicottville,

JERSEY BULL, IDA'S RIOTER OF ST. LAMBERT, JR., A. J. C. C., 39616.
Property of J. W. Helme, Adrian, Mich. (See article on page 108).

nearly all of them patronizing cheese factories, owned mostly by combination; factories open about April 1st and close in November. The milk is all paid for by the pool system. Everyone gets the same, good or bad. As near as I can learn the milk does not bring only about $30 per cow on an average. Hay always commands a good price and grain has nearly all to be bought and has been very high these past few years. Seems as though the cost of keep was more than the income, yet the dairymen seem to be pretty well contented as they are—they don't attend the Farmers Institutes even. As for us we have learned from Hoard's Dairyman that other ways are better, that feed and care amount to much, that a balanced ration is very necessary for good returns and profit.

Now up bobs Prof. Haecker and John Gould saying that so much protein is not needful. Why, I heard John Gould say at an Institute in Ellicottville that cows did not want any corn meal, only give them bran; (question, what if they get thin? give more bran); and now his winter ration of grain is corn, oats and middlings. So where are we at? C. E. C.

Ellicottville, N. Y.

It is always in order to inquire where we are at, but in this particular matter it should not be forgoten that scientific feeding is a matter of very recent growth, and it is not wise to tie ourselves too firmly to any rule or theory. Messrs. Gould and Haecker and others like them, recognizing that the price of protein has advanced 100 per cent and more in recent years, have been experimenting to ascertain whether it is indispensable to feed as much protein as was recommended a few

years ago. HOARD'S DAIRYMAN has been urging them to do this in the interests of the dairymen of the land. It has figured out to its own satisfaction that a very considerable proportion of the protein as heretofore fed is unaccounted for, with the probabilities that it has been used by the animals for purposes where the much cheaper carbohydrates would have answered the same end. The gentlemen who have been making these experiments do not pretend that the problem has been solved in all its relations, but they do say that for the present purposes of milk making, less protein is required than has heretofore been deemed necessary. What the effect of feeding this small amount of protein may be upon the future usefulness of the cow, or the dairy possibilities of her progeny is still an open question, and they are experimenting along these lines.

Removal of Holstein Herd.

ED. HOARD'S DAIRYMAN:—It is the intention of Mr. McGeoch to move the McGeoch herd of Holstein-Friesian cattle from Lake Mills to one of the farms near this city. He is forced to this conclusion from the fact that other business cares, make it impossible for him to visit the herd in its present location, except at long intervals.

As neither the farm here, nor the buildings are large enough to care for the present large herd, he has concluded to hold a public sale here in Milwaukee on May 6th, at which time we will sell some seventy head of the very best cattle in the herd.

While it is with much regret that he is forced to reduce the herd, he believes the breeders will appreciate the fact, that never before has the same high class of cattle been placed upon the block.

Among the number to be sold will be the two great service bulls, Gem Pietertje Hengerveld Paul DeKol, who, in addition to his rich breeding and great individual merit, has already proven himself a sire of the first rank, one of his daughters, Duchess Ormsby 2d's Hengerveld DeKol, holding the World's record for age, and the others are high up in the list; and DeKol 2d's Paul DeKol No. 2, who is probably the best bred Holstein Friesian bull living, as he is a full brother to the great young cow, May Hartog Pauline DeKol, who has just broken the World's record by making 29 lbs., 4.3 oz. in seven, and 112.05 lbs. in thirty days, under official test, at the age of four and a half years.

He is also half brother to the great cow, Lillith Pauline DeKol, who broke the record two years ago by making 28 lbs., 3.8 oz., at four years of age. In addition to this, he has some ten daughters who have qualified for advanced registry by making high official records, so has proven his prepotency as a sire.

A limited number of young bulls, all from most approved sires and from officially tested cows, will be offered at the sale. Believing that breeders will gladly accept the opportunity to buy the best class of cows, we have concluded to place in the sale, the best in the herd, including the great heifer, Duchess Ormsby 2d's Hengerveld DeKol, who holds the World's record for age, having made 19.02 lbs. of butter in seven days, at the age of 2 years, 1 month and 29 days, the average per cent of fat for the week being 4.36.

This heifer is no freak, as her dam has record of 21.31 lbs., average fat 4.16, and her granddam record of 24.80 lbs., average fat, 5.44. Dame Marjory DeKol a half sister of the above heifer, will also be included, she having record at 2 years, 4 months and 24 days of 16.19 lbs. butter in seven, and 65.08 lbs. in thirty days.

Liscombe Aaggie 3d at 3 years, 11 months and 26 days, has a record of 21.58 lbs. in seven, and 86.69 lbs. in thirty days This last is largest record ever made by a three-year-old cow in thirty days.

Piebe Queen 2d's Princsss at 4 years, 9 months, has record of 22.18 lbs. in seven days.

Wit Duchess at 5 years, 5 months, and 5 days has record of 24.88 lbs. in seven days.

In addition to the above lot of cows, we will sell all the cows with large records, that we have in the herd. By doing this we hope to make it the most attractive sale of Holstein-Friesian cattle that has been held, since the system of official testing has been established, and trust that all breeders and dairymen who are looking for most desirable sort of Holstein cows of proven ability, will make it a point to be in attendance.

Milwaukee, Wis. H. B. DAGGETT, Mgr.

Sorghum for Milk.

ED. HOARD'S DAIRYMAN:—Is sorghum a milk producer? Will it make good feed in the fall when pasture is short? How is the best way to sow it, in rows or with a grain drill, the same as oats? How much seed is required to sow one acre?

Bryan, Ohio. H. J. N

Sorghum corresponds very closely in feeding value to corn stover and consequently has about the same value as a milk producer. The following summary from a bulletin of the Nebraska Experiment Station, gives the most important characteristics of sorghum as a forage plant:

Chemical examinations show that the feeding value of sorghum is greatest when the plant is young.

When 2 feet high it contains three times as much nitrogenous matter, twice as much fats, and only two-thirds as much fiber or woody material as it does when it has attained its growth and formed seeds.

Young sorghum is an almost perfect stock food, since it contains flesh-forming materials and fat-forming materials in the ratio of 1 to 7.

When nearly mature this ratio is 1 to 23, the fat-forming materials being very excessive. Therefore the crop should be used for pasturage before the seeds form.

It would be profitable to begin to pasture the sorghum when it is not more than 2 feet high, since the stalks first eaten off will usually produce a second growth of young cane, which will balance the increasing fat-forming properties of the other crop.

Young sorghum is a very succulent food. It contains about 85 per cent of water, or only 15 per cent of dry matter.

Over 150 pounds per day of the green fodder would be required to furnish sufficient food for growing cattle or milch cows of 1,000 pounds weight.

The best results are obtained by using some dry feed along with sorghum pasturage.

As compared with forage plants which are available for late summer pasturage, young sorghum is somewhat deficient in flesh-forming material, containing less than blue-grass or Brome grass, about the same as timothy, and a little more than Indian corn.

Sorghum should be cut for fodder at as early a stage as it can be well cured.

Analyses show that after the period of flowering the sorghum stalk rapidly becomes more fibrous or woody and the proportion of the more valuable food principles is correspondingly decreased.

Sorghum fodder does not possess any great feeding value.

Even if cut while heading out it will have a somewhat smaller amount of flesh-forming material than most hay crops, and less than corn fodder, but more than straw of the small grains.

The fondness live stock have for this fodder is doubtless due to the sugars which it contains.

Its relatively high percentage of heat and energy-producing materials makes it especially adaptable for cold-weather feeding.

For seeding, a good seed bed should be prepared, and if for feed, 10 to 12 pounds of seed per acre should be put in with a wheat drill and the soil planked or rolled afterwards.

"ADVERTISEMENT."

THE VALUE OF CHARCOAL.

Few People Know How Useful it is in Preserving Health and Beauty.

Nearly everybody knows that charcoal is the safest and most efficient disinfectant and purifier in nature, but few realize its value when taken into the human system for the same cleansing purpose.

Charcoal is a remedy that the more you take of it the better; it is not a drug at all, but simply absorbs the gases and impurities always present in the stomach and intestines and carries them out of the system.

Charcoal sweetens the breath after smoking, drinking or after eating onions and other odorous vegetables.

Charcoal effectually clears and improves the complexion, it whitens the teeth and further acts as a natural and eminently safe cathartic.

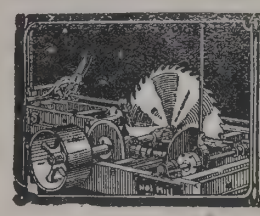
It absorbs the injurious gases which collect in the stomach and bowels; it disinfects the mouth and throat from the poison of catarrh.

All druggists sell charcoal in one form or another, but probably the best charcoal and the most for the money is in Stuart's Absorbent Lozenges; they are composed of the finest powdered willow charcoal, and other harmless antiseptics in tablet form, or rather in the form of large, pleasant tasting lozenges, the charcoal being mixed with honey.

The daily use of these lozenges will soon tell in a much improved condition of the general health, better complexion, sweeter breath and purer blood, and the beauty of it is, that no possible harm can result from their continued use, but on the contrary, great benefit.

A Buffalo physician in speaking of the benefits of charcoal, says: "I advise Stuart's Absorbent Lozenges to all patients suffering from gas in stomach and bowels, and to clear the complexion and purify the breath, mouth and throat; I also believe the liver is greatly benefitted by the daily use of them; they cost but twenty-five cents a box at drug stores, and although in some sense a patent preparation, yet I believe I get more and better charcoal in Stuart's Absorbent Lozenges than in any of the ordinary charcoal tablets."

DIETZ Cold Blast BLIZZARD LANTERN



gives the largest, whitest and steadiest light of any lantern in existence. No wind can blow it out. It is the culmination lantern of over fifty years in the business. Then, too, it is

SAFE AND CONVENIENT.

The least trouble to clean, fill, light or extinguish. Simple side lever raises, lowers and locks globe on burner. Buy no lantern unless you see the name Dietz upon it. It's your protection and ours. A guarantee of high quality. Write us for free lantern catalogue.

Cover Three Times the Ground and Spread 15 Times as Fast as by Hand with the

Great Western Endless Apron Manure Spreader.

And when the job is done it is done to a purpose. The manure does not lie over the field in chunks to waste away, but whatever its character, coarse, lumpy, strawy, caked, fresh, lime, plaster, etc., it is pulverized and evenly distributed, so that every particle enters the soil to nurture plant life. Compared with other spreaders it is THE MACHINE OF MANY SPECIAL FEATURES. Endless apron makes it always ready to load. Spreads thick or thin as desired, 3 to 25 loads per acre. Regulated while in motion. Front axle cuts under and turns on the ground it stands on. Chunks held on beater by non-bunchable rake until pulverized. Combined hood and end gate keeps manure from beater while loading and acts as hood in spreading. Broad tires, meadows and grain fields are top dressed without rutting. Light draft, strong and durable. FULL GUARANTEE with every machine. Write for our large catalogue. It tells how to secure best results from the manure pile and shows how the Great Western has mastered the matter of spreading. Mailed free.

SMITH MANURE SPREADER CO., 59 N. JEFFERSON ST., CHICAGO, ILL.

It pays for itself on the first crop grown after its use.

It Spreads Manure,

wet, dry, lumpy, caked, strawy, full of corn stalks, etc., better than it can possibly be done by hand. Spreads lime, ashes, salt, compost, etc.

THE IMPROVED Kemp Manure Spreader

will save more hard labor, more time, more money and bring about better results than any other machine that can be employed on the farm. It trebles the value of even a small amount of manure. It is the only thing that can successfully top dress wheat in the spring, meadow lands, pastures, etc. Can be hauled onto any land easily and without injury to land, as wheels have broad tires. Can be turned on the ground it stands on, as front wheels turn entirely under. It is strong and durably made of good material and with ordinary care will last indefinitely. Greatly improved for 1903. Send for new illustrated catalogue and "How to Grow Big Crops"—Free. Remember that the only original and genuine Kemp Manure Spreader is made by us and the patents thereon have been fully sustained by a recent decision of the U. S. Circuit Court.

KEMP & BURPEE MANUFACTURING CO., BOX 46, SYRACUSE, N. Y.

New American Manure Spreaders

hold from 50 to 100 bushels. Spread just as thin or thick, fine or coarse, as ground requires. Don't have to stop team to make change. Most substantial, largest capacity, lightest draft.

Send today for Booklet B.

American Harrow Co. Detroit Mich.

Climax Ensilage and Fodder Cutters.

GOOD RESULTS are obtained by using CLIMAX machines. You can fill your silo, cut your dry fodder and pack it away in good shape, far better and in less time, than with any other. Prices no higher than for same capacity of other makes. Few wearing parts; therefore costs little to keep in repair. Several sizes. Tell us what you want to do and we will tell you what size will suit you. Catalogue free. Write for one.

The Warsaw-Wilkinson Co., Warsaw, N. Y.

Old Time Dairying in New England.

ED. HOARD'S DAIRYMAN:—Yours of the 12th inst is at hand and contents noted. I will say that it is no fault of your paper that I dropped my subscription. I am 73 years old and wife is almost 75. We had to give up farming on account of old age. I moved from New Hampshire to Minnesota in 1856, and just as soon as we got in shape to make butter, we were able to get the best price in the market where we were located.

I came here 25 years ago and went into wheat raising, and we made some money at first, but in 1883 we had an early frost that caught most of the wheat so immature that it was not fit for market, and the consequence was, that it put me in "a hole" as the saying was. We were milking 4 or 5 cows and taking our butter to our groceryman for which he was paying us 25 cents per lb.

We found that we had sold about $200 worth when we came to settle our bills. This turned me into a dairyman, and I followed it up until last March when I quit. I have often said that it was my dairy that kept me from a failure.

For the last 15 years I have sold to families and got cash and never less than 20 cents per lb. in summer and where I had a good customer, that was the price by the year. I supplied some families for over 15 years. You have been doing a great work and I wish you well.

My father and mother were engaged in dairying when I was a boy, and I had a boy's work to do in helping the work along. I might give you some idea of how our dairy was run so that you could form some idea of an old New England dairy of 60 years ago. We kept from 12 to 20 cows. We had a dairy room for doing the work in, and a room on the north side of the house to set the milk in at some seasons of the year. Then we had a cellar walled up with nice faced stone and a flat stone bottom.

Our milk was set in a brown earthen pan that would hold about two gallons—these pans were made at a pottery about ten miles from where we lived, and were so made that we could not pile them one into another to nest them, if we did it would split the bottom one in two. These pans were set on the bottom of the cellar, which was cold setting "sure."

The milk was skimmed every third milking and the pans brought up and washed and scalded in a brass kettle set in brick. Each pan singly, by taking it in one hand and dipping it into the kettle of boiling water, then they had to be set out to sun through the day. Just think, if you will, of the work to handle about thirty of those pans over every morning and evening as compared with a "Baby Separator."

My mother was very particular to have every thing clean and our butter used to sell for the top prices in market. L. D.

Crookston, Minn.

Swill-fed Pigs Dying.

The Question not Settled.

ED. HOARD'S DAIRYMAN: Some time ago I wrote you about some pigs that I was losing.

You referred the questions to your readers. The result was several answered and all agreed that it was powered soap or salt in large quantities that killed them. Since writing the first I have read a bulletin issued by Cornell University entitled, "Powered Soap as a cause of death among swill-fed hogs." I find the same symptoms they discribe, with possibly a little variation. They would be off feed first; later would turn dark colored around ears; later along belly and back part of hams; some would have fits; would walk wildly about in apparently a dazed condition between the fits; would die in a fit; froth at the mouth when dying; vulva would look as though in heat; head, belly and hams very purple after death.

I opened several, the lungs would be dark colored, spongy and frothy; little or no gall; stomach of some, full of undigested food; large intestines streaked with blood.

As soon as I read bulletin I discontinued feeding swill. Fed bran, middlings and skim milk, but they kept dying just the same. I have one pig left, has been sick about three weeks, but is much better now, have been feeding all the swill she will eat for about a week; she is no worse.

Do not think it is powered soap in swill, as swill was dry, was gathered twice a week. Several of my acquaintances keep hogs, draw swill; they all are troubled with same complaint, more this winter than common.

Is it cholera, or a disease peculiar to swill fed hogs. Is there any thing that can be fed to cure, or prevent cholera?

N. Y. T. B. NICHOLAS.

A New York Letter.

Inquiry as to Malt Sprouts.

ED. HOARD'S DAIRYMAN:—As I write one of our frequent winter visitors, a howling blizzard, is raging outside; wind very high and air so full of snow one can see but a few rods.

It makes us long for a warmer climate and summer skies.

December milk at the shipping station here, netted $1.38 per can of 85 lbs., or about $1.62 per cwt. January price is 10 cents less per can, but have heard of no reduction for February as yet.

Some factories in this section making butter and light skim cheese netted over $1.60 for November milk and nearly or quite $2.00 in December.

Very little corn was raised last season, consequently many silos empty are or only partially filled, while owing to poor weather in haying, hay is poor quality. This creates a demand for mill feeds, even greater than comman among those not fortunate enough to have well filled grain bins of their own raising.

Last year I raised 500 bushels of oats and peas, which ground and fed with distillers grains makes a very satisfactory grain ration, not the least of whose merits is its cheapness compared with buying all grain fed.

Most milk producers here will feed little but gluten feed, no matter how high the price.

Yesterday I bought a small quantity of malt sprouts, with an analysis of 26% crude protein, 1.01% fat, at $15 per ton, being about $4 less than cost to the feed dealer, who can hardly get rid of them at that price, but a great call for gluten at $26 per ton.

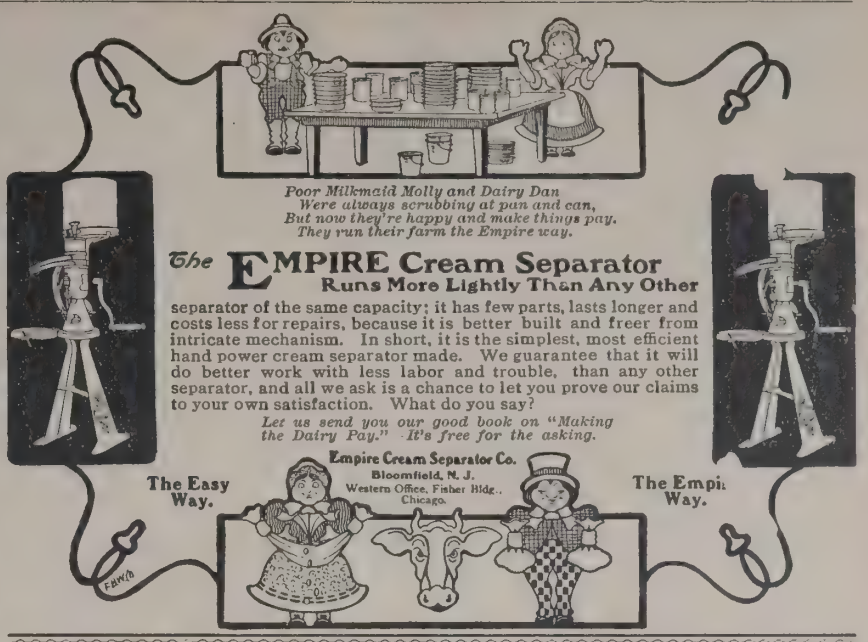
Would like the opinion of the Editor as to the value of malt sprouts either through the DAIRYMAN or by correspondence. I would like to hear from any one who knows anything about Southern or Central New Jersey regarding prices of land and products and dairy conditions generally, also climate and if favorable for persons afflicted with catarrh, etc. Please send me sample copies of the DAIRYMAN and I will try to place them where they will do the most good. L. B. W.

Cortland Co., N. Y.

We have found malt sprouts comparatively a very cheap feed and a very satisfactory one. It is sometimes complained that these sprouts are not relished by cows, but we have personally met with no objections of this kind from our herd. However, we would advise feeding only in limited amounts, letting 4 to 5 lbs. be the maximum allowance for a day.

"ADVERTISEMENT"

ASKING QUESTIONS.



An Inquiry Changed a Man's Whole Life.

When you get a man to recognize that his bad feelings come from improper food and that he can get well by using scientific food, the battle is half won. One of New York's business men says:

"I was troubled for a long time with indigestion, headache, and stomach trouble, and had taken various medicines but with no good results. I concluded to see how a change of food would affect me. I never cared particularly for cereals of any kind, but ate meat and pastry continually and drank coffee.

I found on inquiring, that Grape-Nuts were highly spoken of and decided to give them a trial. To say I was surprised at the result would not begin to do justice to my feelings. My headaches left me; my brain became clearer and active; my attacks of indigestion grew fewer and fewer until they ceased entirely and where I once went home tired, fagged out and indisposed to any exertion whatever, I now found a different state of affairs.

My color was good, my muscles strong and firm and fully equal to anything I asked of them, instead of soft and flabby. I live two miles from my business and walk it daily back and forth, if the weather permits. I am 55 years old and feel as well and strong as when I was 30, and can ride 70 miles a day on a bicycle without feeling any bad results." Name given by Postum Co., Battle Creek, Mich.

WILL IT PAY YOU TO TAKE HOARD'S DAIRYMAN?

W. H. Jenkins took a census in 1901 of 50 farmers who were patrons of the creamery in Montrose, Pa. Twenty-five of them read dairy papers; twenty-five did not. The twenty-five who did read dairy papers averaged $50.23 per cow for the year. The twenty-five who did not read averaged $32.95. Here is a difference of $17.28 per cow. Did it pay the twenty-five to read? Did it pay the other twenty-five not to read? That's not all. Those who did read averaged a profit over cost of food of $15.06 per cow. Those who did not read averaged a profit of 66 cents. Is not that dairy farmer standing greatly in his own light who will not pay 2 cents a week for Hoard's Dairyman? These are hard facts worth thinking over.

We are receiving of late a good many requests for a bundle of copies of HOARD'S DAIRYMAN for distribution. We are very glad to forward copies for distribution, for we need the help of every reader to increase the circulation of the DAIRYMAN. Get up a club of subscribers among your neighbors. If there is going to be a meeting of the creamery or cheese factory patrons, write us for a bundle of sample copies for distribution. If you are going to a farmers' institute, have some copies with you. These meetings afford excellent opportunity to work up a good club. Write us at least a week ahead of the meeting saying how many copies you want and we will promptly forward. Give us your help.

ANOTHER RECORD BREAKING HOLSTEIN COW.

It is reported from New York that Messrs. McAdam and VonHeyne, of the Brothertown Stock Farms at Deansboro, N. Y., have eclipsed the record made by Mercedes Julip's Pietertje in Minnesota, last year. This new candidate for premier honor is Sadie Vale Concordia, a ten year-old cow, bred and always owned in New York, formerly a member of the Yeomans' herd at Walworth in that state. She has had a very distinguished record all through her life, and this last test has been officially supervised by Prof. C. C. Cole, representing the Cornell University Experiment Station.

With that blissful inaccuracy which Holstein breeders still persist in following, Sadie Vale Concordia is credited with having produced milk in seven days sufficient to make 30 pounds, 10.18 ounces of butter, whereas Mercedes in Minnesota, last year, but now owned by Messrs. McAdam and VonHeyne, was credited with 29 pounds, 5.7 ounces. There is no pretense on the part of the better informed Holstein breeders that any such amount of butter could have been made, but because some years ago the Holstein-Friesian Association adopted the practice of adding 25 per cent to the fat in the milk for estimating the yield of butter the same rule continues to be followed. Every well informed person knows that it is utterly impossible to produce standard commercial butter at this rate, even when no allowance is made for the inevitable losses in creaming and churning and it is high time that our Holstein-Friesian friends relieved themselves of the not unjust charge of publishing records founded on such false pretenses.

Neither Sadie Vale nor Mercedes need any misleading statements to establish their claim to the highest honors as butter producing cows, and it is high time that Experiment Stations, which are called in to make these official tests, should be relieved of the implied endorsement connected with the publication of these records. All that the station representatives do is to certify to the amount of milk and the amount of fat contained in the milk, but the records as published seem to imply that the station representatives guarantee the published report as to the equivalent butter. This is bringing the stations into a responsibility that does not belong to them and we suggest that they adopt some measures to relieve themselves from the same.

From the figures given, HOARD'S DAIRYMAN estimates that Sadie Vale Concordia yielded in seven days, 694.3 pounds of milk, containing 24.5 pounds of fat, and that had this milk been creamed and the cream churned, it would have been quite possible to have made 28 pounds, 9.6 ounces of standard commercial butter, and not any more than this. And this undoubtedly is the largest record, supervised by Experiment Station representatives, ever made by any cow at any time.

HOARD'S DAIRYMAN, therefore, extends its most sincere congratulations to Messrs. McAdam and VonHeyne in being the fortunate owners of two such cows as Sadie Vale Concordia and Mercedes Julip's Pietertje.

PRINCIPLES OF ANIMAL NUTRITION.

Under the above title Dr. Armsby has brought together the results accumulated during the past two decades, on the theory and practice of animal nutrition, and the result is a book of some 600 pages, discussing at length the fundamental principles underlying the processes of digestion and assimilation.

As the author states in his preface, the book is not a treatise on stock feeding, and its use will be strictly confined to agricultural chemists, and those who are advanced students in feeding animals.

The nutrition of animals is probably the most difficult subject which enters into the domain of chemistry, on account of the many unknown factors which enter into it, and especially so because of the unweighable factor which we call life, and which enters as an essential part into all investigations which the chemist undertakes. As each animal is a law unto itself in this respect, hard and fast deductions cannot be made from one or several experiments, and it is only by compiling the results from many workers and a large number of trials that deductions approximating the truth can be made. The work which Dr. Armsby has published is essentially a compilation of the statistics of nutrition, and the numerous references show how thoroughly the work has been accomplished.

The subject is divided into two parts: (1) The income and expenditure of matter. (2) The income and expenditure of energy. Under the first head are discussed foods, metabolism, relation of metabolism to food supply, and influence of muscular exertion on metabolism. Under the second head are included force and energy, conservation of energy in the animal body, food as a source of energy, internal work, maintenance and utilization of energy.

The data which furnish the material for a discussion of the above subjects is exceedingly voluminous, and not at the command of the average student, as it is scattered through the scientific literature of several countries, and Dr. Armsby has done a most valuable piece of work in thus bringing this immense mass of material into a shape that it is available to the average student.

FARMERS SHOULD ADVERTISE MORE.

As a rule, the farmer pays but little attention to advertising. He is not used to it, and consequently has not good judgment as to what it will do for him. A few years ago a neighbor had a fine, four-year-old Guernsey bull that he wanted to sell to prevent inbreeding. All that the stock yards people in this city would pay for the animal was $40. He spoke to us about it. We told him that the stock yard was no market for breeding animals. The men to sell that kind of stock to were the men who want them for breeding purposes. We suggested that he put a small advertisement in the DAIRYMAN, but when we told him it might cost him $5, he took fright at once. He could not look beyond that $5. Finally we coaxed him to try it, and he received, he said, a bushel of letters, finally selling the bull for $70, and had to send back several drafts of that amount to those who wanted to buy, but were too late with their money. He made $25 by the investment or 500 per cent. He learned his lesson and practiced on it until his death a year or so ago.

Last autumn we had 460 bushels of fine two-rowed Bavarian barley to sell. All the buyers in this vicinity would pay was 55 cents. A small advertisement in the DAIRYMAN has sold 430 bushels, all we can spare, at $1.25 per bushel, bag included.

A few years ago we persuaded three farmers near this city, who had each a half dozen or so nice Jersey and Guernsey grade heifer calves to advertise them. Answers came from a dozen states, and they all went in a bunch to a purchaser in Idaho. Farmers do not often enough try to co-operate in this way. Somebody must come along and urge them into it. That shows lack of good business enterprise.

Good reward and profit can often be made on many products of the farm, like seed grain, dairy cattle, well bred pigs and fowls, by advertising them in a good farm paper, and especially in the local paper. The paper is a go-between that should be used more than it is. Farmers should use good business judgment as well as merchants and manufacturers. It is more than half the battle to be a good seller.

The Alfalfa Plant.

The Seed Bed.

The most important single factor in raising alfalfa, is the preparation of the seed bed, for this crop demands a very careful preparation of the soil if partial or total failure is to be avoided, for the young alfalfa plant, as so often stated, is delicate and exceedingly particular regarding its surroundings.

The soil for alfalfa should be thoroughly pulverized and deeply plowed, but it must be given time to settle before seeding, and only the surface layer allowed to be loose. If it is necessary to plow the ground before seeding, do it as early as possible, harrow thoroughly and then wait for a good rain to settle the soil before seeding. Seeding on new plowed ground will not give good results. A well cultivated corn field cleared of stalks will make an excellent field for seeding to alfalfa, as it only needs harrowing.

The careful preparation of the seed bed is especially necessary where rain is scarce and in such conditions a deep seed bed is necessary to hold the moisture necessary for the growth of the young plant. The soil must be made fine enough that the particles can come in immediate contact with the young plant and this can only be done by the repeated use of the harrow, repeated several times so the capillarity of the soil will not be interrupted until within two inches of the surface. This necessitates that the lower layers of soil be well compacted either by rolling or by the action of moisture. If the lower layers be well settled and the upper two inches in the form of a dry mulch, the moisture coming from below will be arrested at the point where the seed is placed for germination and the result will be an abundant supply of food continually brought to the rootlets of the young plant.

If, on the other hand, the lower layers of soil be loose as turned up by the plow, the water will not come above the line of soil that has been broken in plowing and the young alfalfa plant is liable to die from drouth and exhaustion.

Heavy clay lands should be plowed deep the previous fall, followed by a thorough use of the harrow in the spring. The alternate frost and thawing during the winter sets free much plant food and makes the tough clayey soil more granular and easier to work in the spring, but whatever the nature of the land it must be thoroughly prepared by use of harrow, roller, or planker, or there will be much labor lost and small returns for years from the poor stand secured.

TIME OF SEEDING.

The young alfalfa plant needs warmth and moisture and is very susceptible to frost, and cold rains are very retarding. If there is moisture in the ground, it may be sown any time from when oats are sown, to the middle of August. In northern localities it is not well to sow after the first of August, as the plant will not make sufficient growth to form a protecting mulch to shelter it during the winter. This is especially necessary in the north and western states where there is great liability of dry, cold winters, and the land is without its protecting layer of snow. This being wanting, the plant must be allowed to furnish its own protection, or it will quickly winter kill. On land that is weedy, an early sowing is preferable to prevent the weeds from getting an undue start and not only smother the young alfalfa plants, but also rob them of the supply of water, which is necessary to the alfalfa, and the growth once stopped the weeds soon shoot ahead.

In southern localities where there is plenty of rain, fall sowing is preferable as it gives the alfalfa a chance to get ahead of the weeds in the spring and there is less danger of the weeds crowding out the young alfalfa plants. It may be said as a rule that if the winters are severe and dry, spring sowing is preferable, but if the weeds are numerous and there is a liability of plenty of rain and a long warm fall then fall sowing is preferable.

THE SEED.

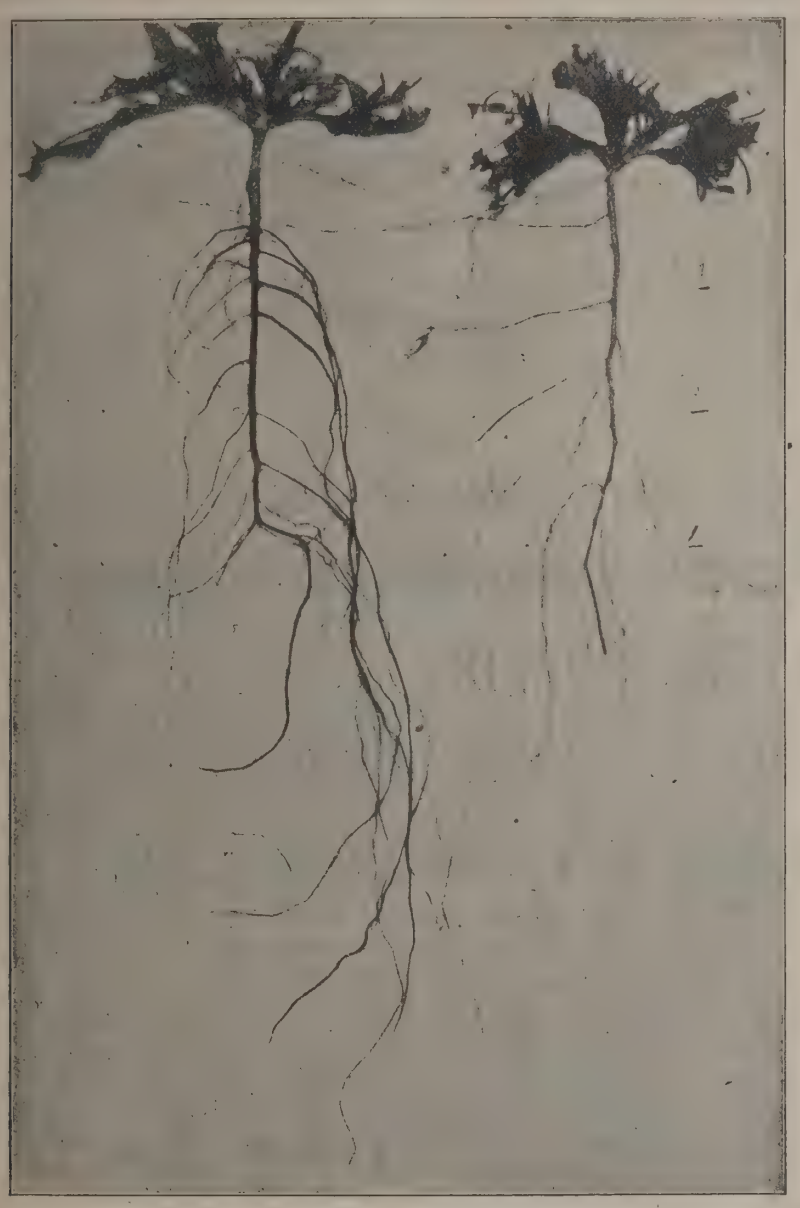
In the south where the winters are light the locality from which the seed comes is of but little importance and so long as it is clean, plump, well ripened and new, it will give good results. In northern states, with long, cold winters the vitality of the plant and its ability to resist must be considered.

As a rule it is best to obtain seed from the same latitude or a little north of the place where the seed is to be sown and in this we are following the rule that applies to other seeds, as wheat, barley, etc. It has also been shown that seed from land not irrigated will do better under unfavorable conditions than seed from irrigated land.

Old seed should not be used, but a moderate age is no drawback, the quality of the seed depending more on how it is harvested and handled than on its age. If the seed is plump and well ripened without stack burn it will keep well for several years, but dark, shrunken seed is always poor.

The new seed is of a bright yellow color, but after the first year grows darker in color. If it is dark and shows signs of

mold, it should be discarded. It should be clean and free from foreign seeds, the most common of which are sweet clover and dodder. Of the two, the dodder is the worse pest and the most difficult to get rid of, as it is a parasite and lives on the alfalfa plant. The sweet clover, if not allowed to seed, will soon kill out, as it is an annual.



Saving expense by using a small amount of seed to the acre is poor economy, both in the beginning and end. There have been cases when 15 pounds to the acre have produced good results, but these are exceptional cases and must not be taken as a rule for average conditions and especially on weedy land. It is better to err on the safe side and sow from 25 to 30 pounds of seed per acre—30 pounds is not too much in Wisconsin. A small quantity of seed is liable to produce a coarse, woody growth, which contains neither so much nutriment nor is so palatable to the stock. It should be remembered that the leaves contain four times as much protein as the stems, the seed, giving it sufficient moisture and causing quick germination.

The usual grain drills are not built so as to handle, in a satisfactory manner, seeds as small as alfalfa, so, to overcome this defect, it is well to mix the seed with equal parts of bran, coarse corn meal or sawdust. In some cases half the seed is drilled in one way and then cross drill with the other half; this does away with the liability of bare spots where the drill may have failed to work, and there is a more even distribution of the seeds.

In some localities where there is abundant moisture, and large numbers of weeds, the seed is planted in drill rows wide enough apart for cultivation by horse power. The above conditions are common in the southern states.

THE NURSE CROP.

The is much diversity of opinion regarding nurse crops. In this locality it is common to sow oats, about 1½ bushels per acre, and cut the oats just as they are heading out. This makes a good quality of oat hay and gives a profitable crop from

ALFALFA PLANTS GROWN ON UPLAND. SEEDED SEPTEMBER, 1901. PLANTS DUG APRIL, 1902. KANSAS EXPERIMENT STATION.

therefore, a large, woody stem and small growth of leaves are not wanted.

HOW TO SOW.

If the conditions are all good, soil and air moist, the most even stand is obtained by sowing the seed broadcast, but these conditions are rare. If there is much wind and there is a dry season, the seed from broadcast seeding germinating close to the surface is soon dried out and the young plants are killed out as fast as they germinate.

The best way to sow alfalfa is with a press drill, especially in soils that are light and liable to dry out or blow. The drill should put the seed just where the soil is moist, and this should not be over one inch from the surface. In very light, dry soils, an inch and a half may be found proper, but as a rule, not over an inch is the proper depth. The wheels of the press drill pack the soil closely around the alfalfa field the first year. Letting the oats grow beyond the heading out point is of decided injury to the young alfalfa plants, both in the large amounts of water they remove during growth and the lessening of the available plant food. This same is true to a greater or less extent of all nurse crops, especially if they are allowed to approach maturity: in such cases they take so much moisture and fertility from the alfalfa that a failure of the crop most wanted is not uncommon. Perhaps the one condition where a nurse crop is necessary is where very light soils are subject to heavy winds. In such a case, the nurse crop might aid in holding the soil and prevent uncovering the young alfalfa plants; but the general tendency seems to be towards dispensing with the nurse crop.

TREATMENT AFTER SEEDING.

If the alfalfa has been sown on heavy soils and there should be heavy rains before the young plants show themselves, there is liable to be a crust formed, that the young plants cannot penetrate. In such cases a light harrowing will loosen the crust and sometimes save the crop from smothering.

Spring seeded alfalfa will usually need to be run over with the mower several times to keep the weeds down. The mower knife should be set high, and the weeds cut so often that they may be allowed to remain on the ground without smothering the young plants. Some experts mow the alfalfa 3 or 4 times the first year, even when there are no weeds, as the pruning seems to make the plant more vigorous. If the cutting of the weeds has been neglected until the growth is heavy, they must be raked off the ground to prevent smothering the alfalfa. No stock of any kind should be allowed on alfalfa the first year of its growth and in the northern states the fall growth should be neither pastured nor cut.

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condense the questions into plain specific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

Brick Silo.

I read a good deal of silo building of all kinds, but not of a brick silo built with air spaces in wall and how thick the wall should be. Is a brick silo as good as any other silo? J. W. R.
Grafton, Wis.

Prof. King, in his work on *Physics of Agriculture*, says that very excellent silos may be made of brick and where brick of good quality can be obtained for $4.25 to $7.00 per thousand a silo which will last indefinitely, may be made at a moderate cost. The foundation should be made of stone and the walls should come at least a foot above the ground and go below the frost line. If the brick portion of the silo is not to be more than 20 feet high, three courses of brick, with a two-inch dead air space between the two outer courses are considered sufficient, but if the silo is to be more than 20 feet high four courses of brick should be used for the lower third; three courses for the middle third, and for the upper third there may be only two courses. Iron rods should be imbedded in the wall between each of the lower doors. It is very important in laying the brick for a silo wall that they should be wet. If this is not done, the brick will so completely dry out the mortar that it cannot set properly and become strong. To make the walls air tight, they should be either given two coats of thick cement wash repeated every two or three years or else be plastered with a good coating of cement mortar.

We do not advise any one to commence building a brick silo, a barn, or scarcely any other farm structure, without first procuring this most excellent book of Prof. King's which is filled so full of the most valuable information, information of a kind which is not otherwise readily accessible, and is in almost daily demand by every farmer. The book costs only $1.75, and this is a very small price to pay for assistance in avoiding the numberless mistakes which a farmer is otherwise liable to make.

A Milk Book Wanted.

I want a book in which to record the names of the cows, with the number of pounds of milk yielded at each milking, and I presume a number of the kind have already been made. If you know of such books, please give me the names of the publishers so that I can get specimen pages. It costs as you know, less to buy one ready made than to have one specially made. W. O. C.
Cave Spring, Ga.

Since receiving this inquiry we have made diligent search for a book that would seem to answer the requirements of our correspondent but without avail, and it is our personal opinion that really such a book is not needed. Let there be a weekly milk sheet kept in the stable, on which to record the weights of milk and the tests from time to time. From these weekly sheets let there be kept in an ordinary ledger, an account with each individual cow, crediting her from week to week or month to month with the milk yield and its amount of butter fat. On the other side of the ledger charge her with whatever may seem to be appropriate in the way of feed and care, and at the end of the year settle with her as with any any other ledger account.

What Crops to Grow.

My farm comprises about 175 acres. About 50 acres of this is in rye and wheat, and about 40 acres in clover. I expect to put 25 or 30 acres in ensilage corn next year, and the question in my mind is as to what would be the best use to make of the balance of the land with reference to the cheapest and best maintenance of 25 or 30 cows. Of course the question is, how most cheaply to get sufficient protein. The soil is a sandy loam.

On the above I shall much appreciate the benefit of your suggestions.

Do you recommend the planting of artichokes for cows and pigs, and if you do, what in your judgment is the best way of getting the crop into the ground, and how should the crop be cared for?
Buffalo, N. Y. G.

Beyond suggesting that in our judgment it would be desirable for this inquirer to commence in a small way with a few acres of alfalfa, we do not feel competent to tender any specific advice. The 40 acres of clover and 25 to 30 acres of ensilage corn will furnish a good deal more roughage than thirty cows can dispose of in twelve months. What other crops to grow must be determined largely, if not exclusively, by local conditions. We should endeavor to raise such crops as would bring us at the ordinary market prices the largest returns, and then in selecting feeds for cows, we should be governed by what home raised grains would sell for in the market and what other food stuffs could be purchased at. This we consider the most economical way of getting protein. If in that vicinity it has already been demonstrated that cow peas or soy beans can be raised with profit, it would be eminently proper to plant a few acres of one or the other or both of these crops, but until their adaptibility to the soil and climate is determined these crops should be grown only in an experimental way.

We have had no experience with artichokes and therefore do not consider ourselves competent to advise in the premises.

Ensilage Molds.

We have been having trouble with our ensilage not keeping perfectly. Our silo is stave, 16 by 23 feet. When filled the joints become perfectly tight.

The ensilage does not spoil near the outside, but a foot or two in from the staves and in the middle we find large pockets of green and sometimes red mold. About ten per cent is in this condition.

This is our third year's experience with ensilage but have never been able to discover the cause of it molding. Previously we did not use any water when filling the silo, but this year kept the fodder well sprinkled but cannot see that the results are any different. Where the ensilage is not moldy it is in fine condition. J. M. M. & S.
Shippenburg, Pa.

We also are quite unable to assign a cause for the molding of this ensilage as reported and if any of our readers can throw any light on the subject we will be greatly obliged for the information.

Idaho Queries.

1. What effect on the test does it have for the samples to get frozen in composite bottles?

2. Can a cow be fed to enrich her milk or to make more butter fat in the milk?

3. Does it make any difference in the test of a cow's milk where the calf is given 2 teats and the other 2 are milked, or is it better to give calf first milk from all and keep for use the last from all teats, or which is the best way to milk with a calf to get the best test from the cow? Our people here do not know how to milk to get the best results and most of them milk with calves? A.L.G.
Menan, Idaho.

1. As frost does not destroy fat it follows that if the composite sample is thoroughly mixed before the sample for testing is removed, freezing will not affect the test.

2. A cow cannot be fed so as to permanently increase the per cent of fat in her milk. This is a matter which is governed almost exclusively by the individuality of the cow. Generous feeding will increase the quantity of the milk, but without changing its quality.

3. It will probably make no difference in the test of a cow's milk if the calf is strictly limited to two teats and the other two milked. The better way, of course, is not to let the calf suck at all, but if for any reason this cannot be, then let the calf have the first milk from all the teats and reserve the last milk for use. The first milk drawn from the udder is not nearly as rich in butter fat as that which is drawn later.

Silo for British Columbia.

Would you kindly send the number of the DAIRYMAN, which contains instructions for building a round silo on the cheapest plan, as I am thinking of building one for 10 or 12 cows. Also, if you have any number containing instructions as to the best way of making oat and pea silage, please send it. C. W. D.
Crofton, B. C.

See the letter on page 99 for suggestions in regard to cheap construction of silos. Oats and peas should be cut for silage when quite green—the oats before turning and the peas when the major part of the pods are fairly filled.

Are Dilating Plugs a Cure for Hard Milkers?

Will a dilating plug cure a hard milker, or do you have to continue to use it day after day and year after year? J. H. A.
Riverside, Cal.

It is doubtful if dilating plugs will permanently cure very hard milking cows. Probably the only remedy in such cases is to use a bistoury or sharp small-bladed knife to sever the sphincter muscle at the end of the teat in one or two places.

Building a Silo with Wood Hoops.

Would like to have your opinion on this silo plan. Diameter 15 feet, three thicknesses, ½-inch green oak hoops, single thickness pine flooring inside and weather boarded outside. Should 3-inch or 4-inch flooring be used? It would be easy to build, cheap, and when it began to decay, it could be lined inside with cement, or another thickness of flooring. Silage without a roof on has a rotten smell down a few inches after a rain, that the stock don't like is my experience. C. C. B.
Clermontville, O.

We think a silo built on the plan above outlined would give very excellent satisfaction. In general practice it may be said that the narrower the flooring used the better, but we should not hesitate to use flooring four inches wide.

Will It Pay to Build Silos in Montana.

K. C. H., of Billings, Montana, writes that they can raise three good crops of alfalfa in a season, and all kinds of roots and asks whether under these conditions it will pay to build a silo.

Ordinarily we do not advise building silos where corn cannot be profitably grown. There have been a few silos built in California for storing alfalfa, but where the weather conditions do not too much interfere with curing the alfafa for hay, and where roots can be cheaply grown in abundance, we are disposed to think that a silo is not a prime necessity.

Simultaneous Feeding and Milking.

Several years ago we had one or two cows and sold a little milk, feeding them when they were being milked. We now milk fifteen and feed them in the same way, which has become quite a burden. Would like to make a change and feed them before milking or after, but fear they will not give down. What would you advise? B. & B,
Dermott, Ark.

The practice in our stable is to feed all the cows just before milking. Those that finish their feed before the milker gets to them are satisfied and stand quiet. The practice at Sunny Peak Farm, as detailed by the young man in charge, at the recent convention of the Wisconsin Dairymen's Association, is to feed each cow immediately before milking, and when asked if this practice did not comsume too much time the young man said that with their system it did not. Cows are very much creatures of habit and when the regular routine is changed they are very apt to shrink in their milk more or less, for a time, but usually recover when they become accustomed to the change.

Progeny from Young Heifer and Bull.

Having to dispose of our registered Holstein bull on account of his kinship to our younger stock, I selected a 10-months calf out of a herd of 5. His color, conformation and breeding were of the best, but the price was much below the price of the other calves. All were registered. Upon inquiry, I was informed by the breeder that both the sire and dam of my selection were youngsters. He was the first calf of a 2-year-old heifer and the sire was a yearling, and for that reason was not as salable. Outside of prejudice, what is the objection to my selection for stock purposes, if I keep him until he is two-years-old or older?
Sandy Hill, N. Y. F. S

We should not object to the animal in question for the reason assigned. History, whether of the human family or of the bovine family, does not prove these objections to be well founded.

Will Heavy Feeding Ruin Cows?

Have 25 cows, Jerseys and grade Jersey and am feeding about 13 lbs, of grain besides shredded corn stalks and hay to each of the heaviest milkers and about 10 pounds grain to the others.

Most of them fresh in October and November last. They are giving from 280 to 300 quarts daily.

Am new in the dairy business and my neighbors say that such heavy feeding continued will ruin the cows in a year or so. Are they right?
Bernardsville, N. J. G. W. T.

We do not think that the amount of grain fed will be likely to injure the cows. The more serious question with us is whether it is profitable to feed so much, and this question can only be definitely settled by actual trial. On general principles, we should consider 10 pounds of grain ample for the heaviest milkers, and probably 6 pounds would suffice for those giving considerably less. This reduction in feed may result in a slight reduction in product, but it may still be more profitable. If the cows now receiving this heavy grain ration are not laying on superfluous flesh the presumption is that they are making very good use of it, provided it is well digested.

An Illinois Ration.

E. B. S., of Griggsville, Ill., has shredded fodder and timothy hay for roughage, rye is worth 50 cents per bushel; wheat, 50 cents; corn, 40 cents; bran, $16.00 per ton; ship stuff, $18.00; oil meal, $25.00. He has a corn sheller and can grind grain on the farm. He is five miles from market and he asks whether it would not be cheaper to grind the wheat and rye feed rather than haul to market and exchange for bran and ship stuff.

There are two objections to using the wheat and rye. One is that they are not as cheap as the corn and bran and oil meal, and the other is that they are too concentrated and do not carry sufficient protein to make a proper ration with such carbonaceous feeds as corn fodder and timothy hay. We, therefore, think it necessary to use some bran in the ration, and would recommend as an average grain allowance for his herd, 3 lbs. of bran, 3 lbs. of ground corn, 2 lbs. of oil meal. This allowance of grain, with approximately 20 lbs. of shredded fodder and timothy hay, will give a ration containing nearly or quite 1¾ lbs. digestible protein with carbohydrates and fat in proper proportion.

Some More on the Breed Question.

ED. HOARD'S DAIRYMAN: In the Feb. 6th issue of the DAIRYMAN under heading of "Which Breed" I read an article by A. R. F. which is quite misleading to one starting in the dairying business.

He claims to be a practical dairyman but his article is written entirely from a Jersey fancier's standpoint, regardless of conditions actually existing in well managed dairy herds of either of the three breeds mentioned by him.

I formerly owned a registered Ayrshire herd, which was selected and bred for dairy purposes, and at the present time I have a registered Holstein herd second to none as to dairy qualities.

Am also connected with a large Jersey herd which contains among the milkers nearly five hundred registered cows, and from my experience, think the article by A. R. F. should be somewhat criticised.

In the first place his figures (which are

Dr. Shoop's Rheumatic Cure

Costs Nothing If It Fails.

Any honest person who suffers from Rheumatism is welcome to this offer.

I am a specialist in Rheumatism, and have treated more cases than any other physician, I think. For 16 years I made 2000 experiments with different drugs, testing all known remedies while searching the world for something better. Nine years ago I found a costly chemical in Germany which, with my previous discoveries, gives me a certain cure.

I don't mean that it can turn bony joints into flesh again; but it can cure the disease at any stage, completely and forever. I have done it fully 100,000 times.

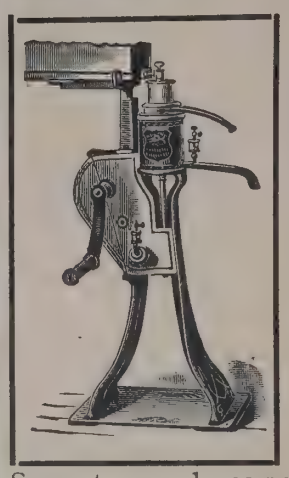
I know this so well that I will furnish my remedy on trial. Simply write me a postal for my book on Rheumatism, and I will mail you an order on your druggist for six bottles Dr. Shoop's Rheumatic Cure. Take it for a month at my risk. If it succeeds, the cost is only $5.50. If it fails, I will pay the druggist myself—and your mere word shall decide it.

I mean that exactly. If you say the results are not what I claim, I don't expect a penny from you.

I have no samples. Any mere sample that can affect chronic Rheumatism must be drugged to the verge of danger. I use no such drugs, and it is folly to take them. You must get the disease out of the blood.

My remedy does that even in the most difficult, obstinate cases. It has cured the oldest cases that I ever met. And in all my experience—in all my 2000 tests—I never found another remedy that would cure one chronic case in ten.

Write me and I will send you the order. Try my remedy for a month, as it can't harm you any way. If it fails it is free.



Address Dr. Shoop, Box 934, Racine, Wis.

Mild cases, not chronic, are often cured by one or two bottles. At all druggists·

The Champion Buttermaker

OF ALL THE ANNUAL WINTER CONVENTIONS

USES U. S. SEPARATORS.

At the Annual Meeting of the Vermont Dairymen's Association, at Rutland, January 6–8, 1903, there were 150 entries of butter, and that of Mr. J. F. McLam, Supt. of the Green Mountain Creamery, West Topsham, received the highest score

98½ POINTS,

and won

GRAND SWEEPSTAKES AND GOLD MEDAL.

This butter was made from cream separated by creamery size U. S. Separators, and was not only the highest score at this convention, but so far this season is the

HIGHEST SCORE AT ANY STATE DAIRYMEN'S CONVENTION

HAVE YOU A STAR MILK COOLER

OR A STAR CREAM COOLER?

These machines will cool down to within 2 degrees of the temperature of the water run through them in the hottest weather.

They are made of such good material and last so long that our agents complain we make them too strong for they never wear out.

NO TIN MACHINE.

ALL COPPER, THOROUGHLY LINED.

Made in all sizes, to be used with water under pressure and without.

at the farm. The **CHAMPION** is simple, cheap, effective—it is the best there is. Our Booklet about it for the asking.

Champion Milk Cooler Co.

67 Main Street, CORTLAND, N. Y.

to be understood an average of each breed in a good working herd) are quite high as to daily milk yield, especially the Ayrshires, and as to 7 days' butter production, 15 lbs. is approximately correct for all three breeds, but the 25 lb. cow he speaks of is not found in any breed only by forced feeding, and is as often met with among the Holsteins as the Jerseys.

He claims that it requires twice the feed for the Holsteins that it does for the Jersey, now that is decidedly erroneous.

The amount of concentrates required by each is about the same. The grain ration of the Holsteins can be substituted to quite an extent by protein crops grown on the farm as alfalfa, sunflower, and soy bean ensilage etc., but the Jersey does not take to this method of feeding as does the Ayrshire, and will fall off both in milk and flesh when subjected to it.

I find the cost of keeping the Holstein does not exceed that of the Jersey, while the cost for the Ayrshire is less.

When a No 1 fancy butter is desired, Jersey blood is indispensible in the herd, as the cream is more exhaustively churned, and the butter has a firmer texture than that of the Holstein or Ayrshire.

As to relative cost of producing butter fat with beef as a side line as Mrs. B. speaks of, I believe there is no breed equal to the Holstein, and the young stock is in equally as great demand as either Ayrshire or Jersey.

For cheese making I find the Holstein and Ayrshire to rank foremost, giving about a 3.8 per cent milk at moderate cost.

The Holstein beef is inferior to none of the dairy bred beef, as I am well convinced from use on my own table, and also selling in the market.

Now I am partial to no breed, only so far as they show superiority in dairy work and true type breeding.

Mrs. B. makes no mistake in following the DAIRYMAN'S advice in selecting Holsteins.

One word more, have plenty of good ensilage to fall back on in time of drouth as well as for the winter months.

Briarcliff Manor, N. Y. F. W.

Profitable Cows.—Helpful Paper.—Good Returns.

ED. HOARD'S DAIRYMAN:—Will you kindly give in your columns what you would consider the most economical balanced ration with herds grass and clover hay mixed, for roughage, and feeds at the following prices: Bran, $22.00 per ton; middlings, $24.00; corn meal, $26.00; gluten feed, $28.00; cotton seed meal, $30.00.

I have a herd of 8 cows, two full blooded and four grade Jerseys, and two natives. Three of them are two-year-olds, the rest matured cows.

The following is their record for the year or 1902:

Value of butter made	$513.96
Milk and cream used at home	45.62
Pigs sold	69.20
Calves sold	31.50
Calf kept	15.00
Total	$675.28
Value of hay and grain fed cows	$226.95
" " " " pigs	36.91
Paid for pigs bought	4.00
Total expense	$267.86
Balance	$407.42
Average profit	$50.93

On December 31 1902, I still had 14 pigs not quite ready for market, which had been fed from the grain charged in the foregoing bill, the profits from which will appear in the record of 1903 instead of 1902.

Our butter is made at home, and sold for 25 cents a lb. for the year.

I have HOARD'S DAIRYMAN and a De-Laval separator. If I had a silo, I think I could increase the profits materially.

Franklin Co., N.Y. J. C. S.

Where a dairyman is able to report such results as are given above, it seems to us a good deal like "Carrying coals to Newcastle" to offer advice in regard to feeding. Whether regard be had to the amount of butter made, or the net returns from the cows, this man seems to have reached a very satisfactory method of feeding and caring for his herd. We only wish he had reported his average ration. If he had, we are more than half inclined to think, it would have included about 4 lbs. bran, 3 lbs. of gluten feed, 1 lb. cotton seed meal and hay *ad libitum*.

To compare this man's record with the records given in our several cow censuses, where the returns were taken from the creamery, it would be necessary to deduct from the value of the butter made the ordinary creamery charges for manufacturing. When this is done there will still remain at least $450 cash income from butter, or approximately $2.00 in money for every dollar's worth of feed consumed. Very few dairymen can make such a showing as this, but it is safe to say that the majority of dairymen might make such a showing if they would. They must, of course, have good cows and must keep a daily record of what each cow does, in order that they may be well advised whether the cows are profitable or not; and then note what Mr. J. C. S. says about a helpful paper, However, it does not suffice to simply subscribe for a paper or to buy books, unless one studies the paper and the books, assimilates the information given and puts it into practice.

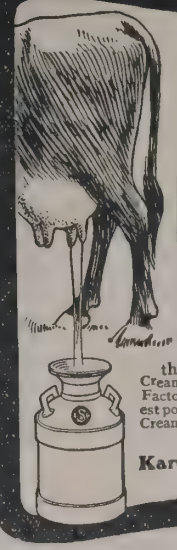
"ADVERTISEMENT."

HE CAN.

Because he has Been Over the Road.



A Grocer down in Texas said that when he first put in a stock of Postum Food Coffee he concluded to try it himself to know how well he could recommend it to his customers. He says: "I quit using coffee and had Postum prepared according to directions on the package and found it a most healthful, toothsome beverage.

I had been troubled seriously with stomach trouble, but after leaving off coffee and using Postum I gradually got better and better. That interested me so I persuaded my Mother-in-law, who is over sixty and a confirmed coffee drinker, to quit coffee and drink Postum.

She has suffered for years with stomach trouble and food coming up in her throat after eating. As soon as she quit coffee and began using Postum this distress stopped and she has been getting better and better ever since.

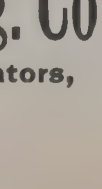
A short time ago a lady who was starting West bought up my entire stock of Postum for fear she could not find it where she was going.

From my own experience one can readily see that I can recommend Postum very highly." Name given by Postum Co., Battle Creek, Mich.

The Cow Man

is pretty sure to be interested in the matter of milk cans. If you happen to be such a man we are favoring you by calling attention to our line of

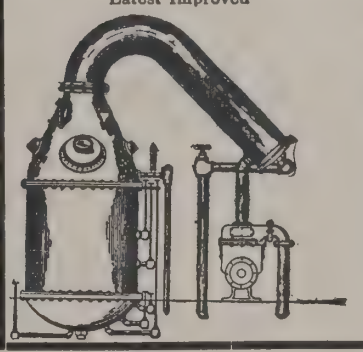
STURGES Standard Approved **Milk Cans**



It is the best made line of milk cans in the world. Cans that are hedged against crushing and denting, seams soldered and tinned and retinned to shut out all chance of rust and secure perfect cleansing, and with perfect handles for convenience and security. The patterns include the famous **Iowa, Elgin, Chicago, Burn, Omaha, Wisconsin,** and other makes. Our Special Milk Can Catalogue will interest you if you want to buy the best.

We also manufacture and sell the now celebrated Dairy Queen Churn, the Boyd Cream Ripener, Success Skim Milk Weigher and a general line of Creamery and Dairy Machinery and Supplies, as well as building complete Butter and Cheese Factories equipped with the latest appliances. We handle only high grade goods and on the lowest possible margins of profit. We have separate catalogs covering the several branches of the Creamery and Dairy Supply business. Write us for anything you need and we'll mail you catalog.

STURGES, CORNISH & BURN COMPANY,
Kansas City, Mo. Chicago, Ills. St. Paul, Minn.



BUHL CANS ARE NOT Like Other Milk Cans Because They Are Better

This is equally true of the **Buhl Factory, "Improved Elgin" and Genuine Iowa Cans**; superior material, design, workmanship, and smooth finish combine to produce those **long wear** qualities for which the **Buhl Cans** are so renowned. **Remember** the Buhl is the only can in the world that is made with the BUHL "VICTOR" CAN BREAST and the BUHL "VICTOR" ROUND HANDLE. They may cost a little more than common cans—we do not know, for we cannot tell how badly "the trust" and others are beating you. We know that the small added cost of the **Buhl Cans** will prove the best can investment you ever made. Every can that is stamped with our famous Milk Can Trade Mark, as shown here is a genuine **Buhl Can.** The mark is a guarantee of all around excellence. Ask your local dealer for **Buhl Cans.** If he does not have them he can get them for you. Write us about it. We will see that you are supplied.

The Distribution of Skim Milk.....

It is known that the just complaints of creamery patrons on account of unfair distribution of skim milk are the bane of the separator creamery business. Further disputes among patrons, annoyances to managers, hindrances to the best work of buttermakers, watering the skim milk, and many other ills in the same train are unnecessary, since the

Barber-Coleman Check Pump

has for more than five years been successfully solving the problem in many different creameries. When a patron has dropped in his check he can pump the amount of skim milk called for by his check, less the percentage taken out as cream, so in like proportion to all other checks. Its measuring apparatus is just an ordinary pump which everyone understands and knows how to operate.

Experience with Clover Ensilage.

ED. HOARD'S DAIRYMAN:—In your issue of Feb. 20, page 29, I note C. W. R., of Newport, Vt., gives his experience in siloing clover and asked if those who have had any experience in this line to give it through the columns of your paper for the benefit of its readers. I will add my mite as it may be the means of saving some one as it has me, some money. As all of your readers must know, in this part of the state of New York it rained almost incessantly from June first until August first. However, we did secure quite a crop of hay, such as it was. The first we cut was the last week in June and much of it was nearly spoiled, and by the time my farmer was through with the last of his haying the first was almost ready to bloom again, but by the time it was ready to cut again our barns were full of hay and grain, and what to do with the second cutting was a question before us. Having one sound stave silo 20 feet in height standing outside next to the bank where we drive in, I readily saw that by building up a scaffold we could easily pitch grass directly in the silo. This was mixed grass about one-third timothy and already headed. We began cutting and drawing and putting it directly in the silo, tramping as hard as as possible.

Some experiments were made by putting in some wilted or nearly dry grass in places, and another was made by letting it stand over Sunday and Monday and again filling, and another by cutting some before dinner and let it wilt for two hours or a little more, as that was on top, it was thoroughly sprinkled and tramped hard.

Some may say: "Why not run it through the cutter?" It would be better in many ways as it would pack better and would feed out better also, but as help was very scarce at the time we concluded upon the whole to leave the Blizzard standing in the barn and see what could be done in a cheap way, as three men could easily cut and put in quite an amount each day, but to work it rapidly four would be better, as one team could be kept on the mower and one on the wagon all the time, and cut only as it was taken up.

Now for results: As soon as we needed extra feed in November we looked after our grass silo, as the other two had been filled with corn.

In the meantime two hoops about one-third of the way down from top broke, and had to be mended.

The hoops could not be drawn up quite tight again, therefore some loss in that direction. But the loss, considering our mistake, was but small, about one two-horse load of mouldy stuff was drawn out and spread on the field. Except some around the outside where the hoops broke, all was fine feed. The cows were fed what they would eat up clean, twice a day, until about the first of January. Thinking perhaps some fresh cows were not getting quite feed enough, another silo was opened that was filled with corn, ears and all. A feed of 20 lbs. per day was given, instead of the grass ensilage, but with no increase of milk. The clover has kept well; as the first of March will finish it, you see we have lately fed it slow. Some care had to be exercised or the cows would over feed on it.

I am so well pleased with my venture that I shall try to have some second

Farm Wagon Only $21.95.

In order to introduce their Low Metal Wheels with Wide Tires, the Empire Manufacturing Company, Quincy, Ill., have placed upon the market a Farmer's Handy Wagon, that is only 25 inches high, fitted with 24 and 30-inch wheels with 4-inch tire, and sold for only $21 95.

This wagon is made of the best material throughout, and really costs but a trifle more than a set of new wheels and fully guaranteed for one year. Catalogue giving a full description will be mailed upon application by the Empire Manufacturing Co., Quincy, Ill., who also will furnish metal wheels at low prices, made any size and width of tire to fit any axle.

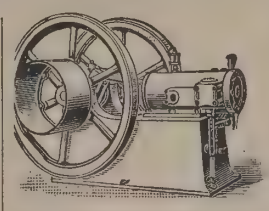
GASOLINE ENGINES

as power for the dairy have passed the experimental stage. Many dairymen now have them and all eventually must have them. The only questions to decide are the amount of power needed, and the most desirable make. With twenty-seven years of experience behind us, and a plant that has grown from 50 engines a year to 1500 a year capacity, we feel that we are equipped to build the best. There are other reasons why the "OTTO" is superior. We will tell them in this space from time to time. If in the meantime you need power, write us, mentioning this paper

THE OTTO GAS ENGINE WORKS, Philadelphia, Pa.

LAMBERT
Gas or Gasoline
Is the reliable engine. No long shut-down for repairs. Simple, economical. Easy to regulate speed. Strong guarantee.
Agents wanted. Write for catalog.
LAMBERT GAS & GASOLINE ENGINE CO., Anderson, Ind

DON'T BUY GASOLINE ENGINES UNTIL YOU HAVE INVESTIGATED "The Master Workman," a two-cylinder gasoline engine, superior to all one-cylinder engines. Costs less to buy and less to run. Quicker and easier started; has a wider sphere of usefulness. Has no vibration, can be mounted on any light wagon as a portable. Weighs less than one-half of one-cylinder engines. Give size of engine required. Please mention this paper Send for catalogue. THE TEMPLE PUMP CO., ESTABLISHED 1853. Meagher and 15th St., CHICAGO.



No Water here to Freeze!

If you want a..... **Gasoline Engine**

that will be always ready to start, safe, reliable convenient, economical and durable, buy a FULLER & JOHNSON Frost Proof. No bother with water nor expense of broken cylinder, no waiting for wind or weather. All sizes, stationary and portable. Send for descriptive catalogue to the manufacturers.

FULLER & JOHNSON MFG. CO., Madison, Wis.

THOMPSON-LEWIS GASOLINE ENGINES

furnish the greatest possible power at the lowest possible cost in time, labor, fuel and money. They are so simple that anybody can run them without expert training or experience. Our **Volume Governor** gives uniform speed. Our **Acme Mixer** is the most positive and economical on the market. Our **Hand Starting Lever** starts engine with least effort. All bearings of **Phosphor Bronze.** Best material and workmanship throughout. Many sizes from 4 (actual) h. p. up. Best for all farm work—cutting and grinding feed, sawing wood, pumping water, separating cream, churning, etc. Send for our free catalog before you buy. It may save you time, money and annoyance.

CONCERNING OUR ADVERTISERS.

BUGGIES FOR THE MILLION.

The opportunity to get one of the famous Split Hickory Vehicles at the low prices at which they are now offered to the public by the manufacturers is one that is the part of wisdom to take advantage of. Especially is this true in view of the fact that thirty days are allowed every purchaser who desires it, to try the buggy on his own premises and ascertain by actual use and inspection how good the vehicle actually is. The first step, and the wise one is to send your address to the Ohio Carriage Mfg. Co., Station 154, Cincinnati, Ohio, for their illustrated catalogue and price list. The rest of it is easy. Their catalogue illustrates and quotes prices on vehicles, harness and saddles of every description also, and will be found interesting to all horse owners. Write them for their catalogue and please mention HOARD'S DAIRYMAN.

Sturges & Burns Co., of Chicago, Ill., have sent out the following "notice to the trade:" Through a fire which occurred on the 21st ult., a portion of our factory was damaged; there will be naturally some delay in getting out orders in hand, but which, however, will not exceed ten days, and we hope you will bear with us under the circumstances. If you will send in your further orders we assure you they will be appreciated and the slight delay will not be such as to inconvenience you.

A Holstein-Friesian bull is wanted by Wm. O. Jackson & Sons, South Bend, Ind. Read their ad. among Holstein-Fresian ads on another page for particulars.

The Whitford Improved Calf Feeder is advertised on another page of this issue by the manufacturers, Messrs. Mahler Bros., of 32 La Sale St., Chicago. Since calf feeders are being very generally used, the main question is not whether to buy or not, but what one is the best. The Whitford seems to have some decided advantages, It is easily attached to the fence or building and detached as easily. The ball-and socket construction gives the nipple a perfectly free motion in any direction, thus approximating as nearly as possible the natural method. Cleanliness is as important here as in "baby's bottle." This style of feeder takes apart easily for cleaning. Write today for free circulars. Address as above.

DAIRY MARKETS.

ELGIN, Ill., March 9—Butter—No butter was offered to-day and there were no regular sales. The market was declared firm at 27½c. Output of the week, 508,600 lbs.

For the land's sake—use 'Bowker's' Fertilizers. They enrich the earth and the men who till it.

Carlots of Separators

One of our would-be competitors, whose most successful department has always been his advertising one, is industriously circulating the story of a "trainload shipment West of twenty-four cars of separators."

Unkind critics say that nearly all of these cars were nailed up before the public was invited to inspect the wonderful array and the suspicion exists that there was not much in some of them; while it is said that a number got "hot-boxes" and had to be cut out before many stations away from the starting point; and others say that the manufacturer in question had been saving up stock for the event for six months past and that it represented a season's shipment.

However, there would be nothing very remarkable about such a spectacle even if true. We ship **double that many cars of machines every month and to single customers of the De Laval machines**—the Continental Creamery Company of Topeka, Kas., and the Beatrice Creamery Co. of Lincoln, Neb.—have **each** ordered **more than that many cars of machines** for their own account during the first six months of 1903. Many other agents and creameries will use nearly as many.

All the big, successful and long experienced users of separators are users and patrons of the **De Laval** machines. This fact of itself is the strongest possible testimony to their all-around superiority, whether bought in carlots, trainloads, or the single machine of the ordinary purchaser.

Pure Maple Sugar and Syrup For Sale—Made on our own farm. Reference: Citizens Bank of Arcade, N. Y. Address, W. H. RICE, Chaffee, N. Y. 15-2

Building up a Dairy Herd.

(Paper read before the Round-up State Farmers' Institute at Owosso, Mich., Feb. 26th, 1903, by J. W. Helme of Adrian.)

In the year 1893, being dissatisfied with fruit growing on my forty acre farm in Adrian city, I determined to change to dairying. Having no practical knowledge of expert dairying, my first step was to post myself and I subscribed for HOARD'S DAIRYMAN and other papers. After reading these, I determined to have a thoroughbred herd of some dairy breed, and upon the conclusion of the World's Fair test, I naturally selected the Jersey. I next subscribed for the *Jersey Bulletin* and bought all the Jersey literature I could get to post up on Jersey families.

After considerable study I decided on the St. Lambert family, and especially the Matilda branch of that family. Matilda 4th, who gave 16,000 pounds of milk in one year, was to my mind the greatest Jersey cow that ever lived. I had $500 to buy stock with, and the question came up, shall I buy ten "fair" cows and have my herd in operation at once, or shall I buy one or two extra cows and breed up. My cupidity said "buy ten"; my good judgment said "buy the best at any price."

I finally purchased a grandaughter of Matilda 4th, for which I paid $300 spot cash. She was in calf to the best living bull at that time, the sire of Ida Marigold who had just won sweepstakes at the World's Fair. She dropped me a bull calf, just what I wanted to head my new herd.

Pretty big price you say. Well, she was the best investment I ever made. Last year, at the age of sixteen years, she dropped me a calf that I sold for $75, and gave me 7,000 pounds of milk which sold in the form of cream for over $100, and she has been doing this for each of the nine years she has been with me. She was not a phenomenal milker, but very persistent, hard to dry up, rugged and healthy. She had a pedigree in which every animal had been a star. This is what counted the most. Today every animal in my herd, twenty-five in number, are her daughters or grand-daughters, and every one in milk will produce more milk and butter when mature than she.

Here is the first lesson in building up the herd.

Like produces like, but more often the likeness of an ancestor. A calf from an extra fine grade cow may "take back" to a worthless ancestor. The foundation of a dairy herd should be a great performer, with a pedigree full of great performers. Neither alone will do. We should have both. Thus, the more star performers in the pedigree, the less chance you have of drawing blanks in the offspring. I also bought another registered cow for $150 of similar breeding. With these two cows I founded my herd in March, 1894.

To review briefly: To start a dairy herd, first read the dairy papers and books, and get posted. Next, select the breed you like best, for that is the one you will be the more liable to be successful with. But it should be a dairy breed, viz.: Jersey, Guernsey, Holstein, or Ayrshire. Avoid the beef breeds for the dairy, and especially that mythical thing known as the "general-purpose cow." A cow does one of two things with her feed, she puts it either on her back or in the milk pail. She cannot do both. For foundation animals, get the best. The foundation cow should be a good performer, with a pedigree of good performers behind her. The sire should have a similar pedigree and a great mother behind him.

Now, we have got a start, the process of grading up is the work of years. However good the herd is, there will always be a "poorest cow." A better one must be raised to take her place. Dairy calves should be raised on skim milk, bran, clover hay and pasture, feeding liberally, but not of any fattening food. Breed not younger than 15 months old and not older than 21 months, varying according to the size of the heifer.

In my experience, the three months preceding the birth of the first calf is the time to make the cow. During these three months I feed all the grain they will eat up clean and plenty of roughage. The young heifer must at this time develop her calf, her udder and keep up her own growth. Never does she need as liberal a feeding as at this period, and as milk fever never occurs with first calf, there is no danger.

Having got the herd in milk, the next things necessary are scales and a Babcock test. Every cow's milk should be weighed night and morning and a record kept of the same. Get a spring balance that weighs 30 pounds; set back the dial the weight of the milk pail; make a blackboard at the barn, ruled to accommodate a week's milk record. The milker then has only to hang his milk pail on the scales and record the result on the board—not two seconds of extra work. Each week remove the record to your dairy account book. You will be surprised how the cows will vary from your estimate of them. At the end of the year many a cow that required two pails to hold her milk when flush will be found behind her more modest sister who kept everlastingly at it.

Now you can begin to cull; discard every cow that goes dry on her own notion; while every cow should be dry six or eight weeks previous to calving, she should be forced dry. She ought to be giving at least sixteen pounds per day when you start in to dry her up. Discard the cow with short teats, she takes too much time to milk; also the cow with a dainty appetite. The profitable dairy cow should eat everything in sight. Every year select the two most promising heifers to bring up to take the place of the two poorest cows.

Sires may be bred to their own daughters, but not to their grandaughters. A change of sire is necessary at this time. Get the very best you can buy; remember he is half the herd, and if he is only common your herd will go backward instead of forward. Never breed to anything but a thorough-bred sire, and above all, don't cross breed. Think a minute of what you are doing by cross breeding. Here stands a Jersey; for seven centuries the farmers of Jersey Island have been breeding her to produce milk and butter. Think of it! Seven centuries of brain and labor in that little animal to get the blood running to milk and butter. Here stands a Short-horn, bred for a like period to produce beef. How thoughtless the farmer is, who at one fell stroke destroys the work of seven centuries. How egotistical to think that one man in a year could improve the thought and labor of centuries.

Select your dairy breed and stick to it. If you can not afford thoroughbreds then get grades of the same breed, but avoid scrubs and cross breeds. Feed grain every day in the year. The benefit will come not so much at once in extra milk as it will in the succeeding years from the extra condition of your cows and the effect on their offspring, which is your future herd. I give in the following table the results of my herd for the celandar year of 1902. No cow should be kept unless she gives 6,000 pounds of 5% milk after her second calf. While I milked 12 animals during the year, three of them were

Spring Humors

Cause many troubles,—pimples, boils and other eruptions, besides loss of appetite, that tired feeling, fits of biliousness, indigestion and headache.

Matilda, 16 years old	6806	5
	75157	
Annual average per cow, 6832 pounds.		5.4

Each of the above cows was dry during the year from 4 to 8 weeks. The above figures indicate a butter production of 4,600 lbs. or over 400 lbs. per cow.

The milk of this herd is made into cream and the cream sold directly to the consumer in Adrian city. Considerable skim milk is also sold at 2 cents a quart. Balance of skim milk goes to feed thoroughbred calves, all of which are sold for breeding purposes. Under such circumstances the returns are hardly a fair comparison for the average dairy herd. I give them for what they are worth. Cream and skim milk sold during the year, $1,350. Young stock sold $325, making gross returns of over $150 per cow.

These figures do not include milk and cream for a family of six, nor two quarts a day for the hired man, nor butter that we get from an occasional churning when the cream trade is dull, nor calves on hand dropped during the year.

I think that after looking over these results I feel that my method of building up a dairy herd has been fairly successful.

Raising Alfalfa in Idaho.

Some Dairy Conditions.

ED. HOARD'S DAIRYMAN:—I am sometimes called the alfalfa crank of these parts as I usually have better success than my neighbors in getting a good stand. It has been my delight for twenty years to seed, raise and feed lucerne, as it is more commonly called out here.

My way in this climate is as follows: Plow the land in the fall or as early in spring as practicable, let it lay till the latter part of May, then, if clay land, disk; if sand or soft loam, harrow smooth and then pack the land with a heavy roller.

A sheep herd is still better; then plant four pounds and not to exceed six pounds of seed to the acre with a press drill. Never plant anything else with it unless you are born for luck. Alfalfa loves sunshine and lots of it. The hotter the shine the faster the growth.

If the season is dry, weeds or grain of any kind absorbs the moisture and retards growth the same as weeds in corn or any other crop. If the season is wet the alfalfa needs the air and sun. I repeat, for a good stand of alfalfa give it clean ground and plenty of sun.

Don't mow it as some recommend; that is the first crop after seeding until it begins to bloom. By that time the weeds, if there are any, will be ripe and will not start again so quick.

When mown don't leave the crop on the ground, as some recommend, as the shade is not what it wants. Rake the crop up clean with a horse rake, set the rake to dig all it will. Never be afraid to scratch lucerne ground. The above theories are positively demonstrated to win in my land and climate. Further than that this deponent saith not.

Your paper has considerable interest for me though the major part of it is Latin or Greek to me. I have never seen a silo, as corn is not a crop here. Never see oil cake or cotton seed this far west. Flax seed is sold here as a drug at fifteen cents per pound. Gluten meal we know nothing of.

We quarantine against Jersey cattle as carefully as any other pest. I have a a thirty-five cow dairy. That is what I suppose you would call a parody on a dairy, as I milk in open sheds, let my cows lie out only when I am milking. Having large cows they act as a cold storage. When it is very cold weather they hold up their milk, and when the thaw comes they let it down.

We don't move our sheds to get away from the muck, for the reason that in the summer we take our cows out on a range and don't need the sheds moved. In winter they are frozen down, and we can't move them. We breed for long legged cows so their teats won't drag in the mud when it thaws, and they don't get scratched up so bad in the brush on the summer range. By letting them lie out in the snow in cold weather if their teats crack, the cracks freeze up and heal quicker than in warm stables.

For a balanced ration we feed all the whole straw they will eat and all the lucerne we can afford. We have a separator and churn and tread mill power. Feed the skim milk to calves and pigs. Just keep what pigs will thrive on the milk and buttermilk and dish water. Pigs have no shelter. Keep warm by squealing and rustling for center place.

We put a little milk in the bottom of a pail, let one calf have his nose in the pail and a calf on each ear of the one with his nose in the pail, then a calf on that calf's ear and so on *ad infinitum*.

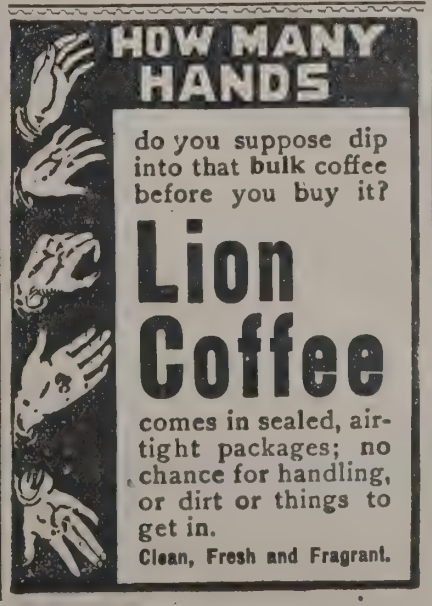
Our cows are every kind and color but Jersey, from Texas to Canada. The only condition in buying, they must be long legged, gentle and easy to milk. If a cow is easy to milk, we never turn her down whether she gives a quart or only a pint. If we get a kicker or hard milker, we cross her with the butcher's block to improve the breed.

We pasture stubble and all other fields we can get our cows into, and they are good rustlers. The summer ranges consist largely of sheep tracks and rocks with plenty of mountain scenery. The cows travel over very steep hills from four to ten miles per day. Some of them lie out and only get milked from two to three times per week, but as the weather is cool in the mountains, the milk don't sour in their bags only when it thunders very hard. In June last they had in the yard from 4 to 6 inches of snow for several days at a time. Now from this conglomerate herd, under the above conditions from January 1st, 1902, to Jan. 1st, 1903, we have sold:

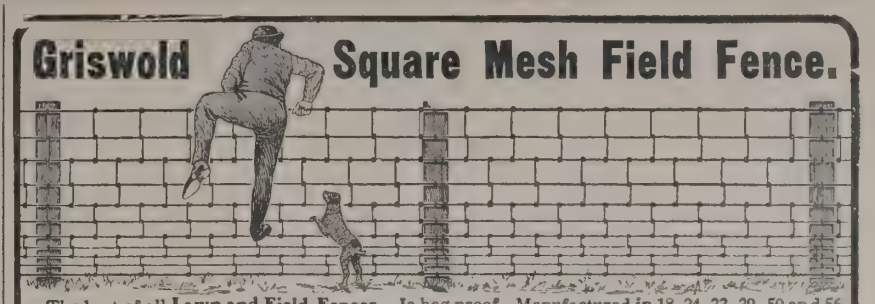
Pigs sold	$240.00
Market price of calf crop	600.00
Butter and milk used in family of 15	200.00
Have sold on the market. butter	1950.00
Total	$2,990.00

EXPENSE ACCOUNT.

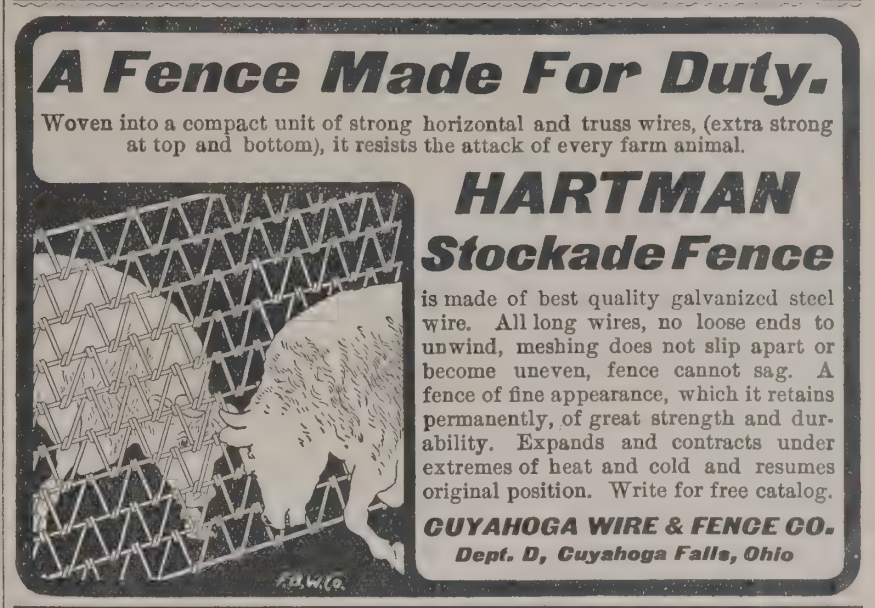
To one hired hand	$420.00
To interest on value of cows	150.00
To four girls old enough to help	600.00
To wife for tending babies and post office, and helping churn.	600.00
To separator oil for U. S. separator and sundries	50.00
To 150 tons alfalfa at $4 per ton	600.00
To six months of stubble fields and mountain scenery	180.00
To myself for keeping girls and hired hand at work and playing with babies	390.00
Total	$2,990.00



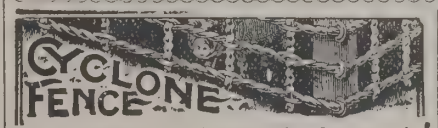
Can any of your advertisers furnish us a breed of cows to the following order?



Dehorned, detailed, and left hind leg should be a little longer than the other and consist of one straight bone and be braced from gambrel joint to shoulder to prevent any forward movement, with a capacity for carrying milk over on Sunday, holidays and rainy days. Warranted to stand in any climate while being milked. With a shield in front of the bag to prevent wire scratches while going through the wire fence into the neighbor's field. Provided with a safety valve as an insurance against lucerne bloat.

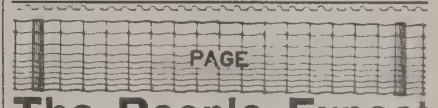


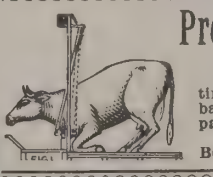
The above described, all-purpose cow will find ready sale in the wild and wooley west.

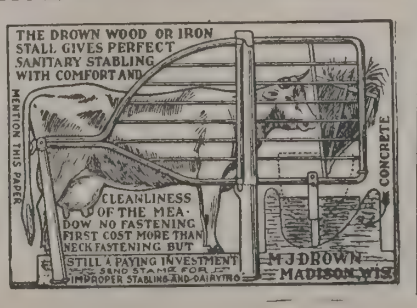


WOOLEY WEST.

Idaho.







DO NOT FORGET to write THE WASSON STANCHION CO., CUBA, N. Y., if in need of Cow Ties or Stanchions.

VETERINARY.

Queries in this department answered by DR. A. H. HARTWIG, Watertown, Wis.

Lump Jaw.

What is lump jaw? Is it curable and what will cure it? J. W.
Hibbing, Minn.

ANSWER.

This disease is due to the presence of the germs known as Actinomycoces which locate in the vicinity of the lower jaw and cause tumors of various sizes which, as time goes on, attach themselves to the bone. As long as the tumor is free from the bone it may be removed surgically with the best results, but after it is once fixed to the bone there is no reliable cure.

Probably Blood Poison.

I have a cow that has a swelling between the horns, and also over the right eye around the horn. The enlargements are as hard as bone. She has been dehorned. The swelling first appeared some weeks ago and the cow then suffered great pain, holding her head high in the air and uttering groans continuously. She also rubs the enlargements against the wall. SUBSCRIBER.
Miles Collier Corner, Ga.

ANSWER.

The enlargements appear to be due to blood poison which may have resulted from the dehorning by using a rusty saw, or infection may have taken place later by coming in contact with any unclean object. It is advisable to poultice the enlargements twice daily with warm linseed poultice to favor an eruption. You may give the animal the following; quinine sulphate, 1 ounce; gentain root (powdered), 3 ounces; dried sulphate of iron, 1 ounce. Mix, and make into 12 powders, give one in food or drench twice daily. It is best not to use the milk.

Abortion—Shedding Teeth

I had four cows in my herd that had abortion when about six months along. I separated them from the rest, and have had no more. Would they be good to keep over for another year, or better to let them go to beef?

I have a three-year old mare coming four in the spring. She does not seem to do well. Hair is rough and dry, and she looks gaunt all the time.
Burke, N. Y. J. G.

ANSWER.

Keep them separate until they are entirely over the discharge from the vagina and do not breed them for at least four or six months after abortion; if you do they may infect the bull and carry the disease through the entire herd. It would be advisable to disinfect the genitals of these cows as prescribed for abortion on page 1036 of the DAIRYMAN, Jan. 16, 1903.

The colt is shedding her temporary teeth and there may be some difficulty in doing so. Have the teeth examined and you will find the cause of your trouble.

Retention of Placenta and Other Items.

No. 1. Jersey cow calved three days ago, but does not clean afterbirth. She has been troubled that way every time she calved. I tried to unbutton the afterbirth, but it seems grown on. I got considerable of it away, most of the buttons: it smells decayed.

No. 2. I now have three heifers 18 months old; they did not get enough to eat, and are small but well bred; they are with calf. I am feeding them oats, bran, oil meal and corn stover. They are fat now but small. What shall I do with them?

No. 3, Have two horses; they have had worms two years, and still have them. G. K.
Racine, Wis.

ANSWER.

No. 1. If you do not understand how to remove the placenta completely, you should not attempt to tear away part of it, as that will make it difficult to get it at all. By the time you read this answer it will be too late to attempt to remove the balance by hand. Take a teaspoon-

Free to Horse and Cattle Owners

Our two large booklets telling how to cure Lump Jaw in cattle, Spavins and all kinds of blemishes upon horses, also Fistula, Poll Evil, Sweeny and Knee-Sprung. Inexpensive methods, easily employed by anybody, and that cannot fail to cure

We know of over 140,000 farmers and stockmen who rely upon these same methods, and for whom we have saved hundreds of thousands of dollars. Books mailed free if you write stating what kind of a case you have to treat.

FLEMING BROS., Chemists, 228 Union Stock Yards, Chicago, Ill.

Paint Without Oil.

Remarkable Discovery That Cuts Down the Cost of Paint Seventy-Five Per Cent.

A Free Trial Package is Mailed to Everyone Who Writes.

A. L. Rice, a prominent manufacturer of Adams, N. Y., has discovered a process of making a new kind of paint without the use of oil. He calls it Powdrpaint. It comes to the farmer a dry powder and all that is required is cold water to make a paint weather proof, fire proof and as durable as oil paint. It adheres to any surface, wood, stone or brick, spreads and looks like oil paint and costs about one-fourth as much.

Write to Mr. A. L. Rice, manufacturer, 346 North St., Adams, N. Y., giving the name of the dealer from whom you buy your paints. Mr. Rice will send you a free trial package, also color card and full information showing you how you can save a good many dollars. Write to-day.

A Handsome Book

About Mandolins, Banjos and Guitars, Free.

Any one interested in the subject of mandolins banjos and guitars can obtain a beautiful book about them free by writing to Lyon & Healy, Chicago. It contains portraits of over 100 leading artists, together with frank expressions of their opinion of the new model Washburn Instruments. Descriptions and prices of all grades of Washburns are given, together with "Facts about the Mandolin" and "How to Play the Mandolin."

LYON & HEALY,
100 Adams St., Chicago, Ill.

Washburns are sold by leading music dealers everywhere.

A choice lot of Young Bulls 3 mo. to 1 year old from heavy milkers at farmers' prices. Also cows and heifers. HOWARD COOK, Beloit, O.

MRS. LEA'S MILK AND BUTTER PURIFIER.

Removes all Weed, Garlic, Vegetable and Animal odor and taint from the milk and in no way injures the cow to which it is fed.

Maj. H. E. Alvord, Chief of the Dairy Division, Agricultural Department, Washington, D. C., says in a recent letter: "It seems to me that the experimental stage of this matter has passed **Everybody** as far as I know (and I have been interested to make diligent enquiry) who have used the "Purifier" intelligently, is satisfied that it does what is claimed for it, remarkable as some of these claims are."

Dr. J. W. Mallet, Professor of Chemistry, University of Virginia, Charlottesville, Va., says: "The Preparation in question (Mrs. Lea's Milk and Butter Purifier) contains nothing capable of injuring the cows receiving it or in any way rendering the milk and butter of such cows injurious or objectionable for human consumption."

Manufactured by VIRGINIA CATTLE FOOD COMPANY, Danville, Va.
Write Us for Prices and Further Information.

THE BROWN BESSIE HERD

Offers some splendid young cows and heifers bred to Recorder, the only living son of the famous **Brown Bessie,** winner of the 30 and 90 day butter test at the Columbian. Also a few sons of Recorder from daughters of Diploma and other tested cows are offered.

in perfect working trim. Reason for selling—being away from home can not give proper attention.

FOR RENT—an excellent farm, 175 Acres in cultivation, near the Iron Mountain R. R., 30 miles from St. Louis the great World's Fair City. Also within 2 miles of two very large manufacturing industries. Well adapted and fitted for dairying and Milk shipping. P. O. Festers, Mo. For further particulars address

C. H. FAKE, Bonne Terre, Mo.

Exile of St. Lambert

—13657—

is the sire of more tested Jersey cows than any bull living or dead, and the number to his credit will probably never be equaled by any other bull. His dam was one of the largest milkers among Jerseys, and is the dam of the three year old cow with the highest year's milk record for that age. Exile's sire is the grand sire of the cow holding the highest milk record for a year.

The mid-winter sale lists include a few tested daughters of this great bull and several cows and heifers deep in the blood that produced this famous sire. If you wish to improve your herd, or to start one, you will probably never have a better opportunity than is here offered. If interested write for lists, and please specify whether bulls, cows in milk, or heifers, are wanted.

THAT NEW BULL

If you want a good Jersey Bull, ready for service this summer or fall, write NOW for our sale list No. 1. St. Lambert, Brown Bessie, Signal and Tormentor blood. Dams all great workers with high fat tests. Full particulars as to breeding, and milk flow, etc., of dams upon request. Address, E. E. STEVENS,
North Madison, Lake Co., Ohio.

The Evergreen Farm Herd has for sale three or four A. J. C. C. heifers bred. Also a few cows and some choice bull calves from two to six months old. Write for pedigrees and prices.
N. N. PALMER & SON, Brodhead, Wis.

FOR SALE

Pedro Bull, 4 years old, kind and sure. Also young cows, Signal and St. Lambert blood, at farmers prices A. A. EGGLESTON,
Painesville, Ohio.

ful of permanganate of potash in two gallons of warm water, and inject into the uterus (all at one injection) allow this to remain as long as she will keep it, then follow with as much warm water; this will flush out all the sloughing particles of placenta. Repeat once daily until clean.

No. 2. Keep the heifers and give them a chance to show what they can do at the pail. Small cows are often large producers.

No. 3. To remove the worms give the following: Santonin, 20 grains; Barb. aloes, 6 drams; oil of turpentine, 1 ounce; linseed oil, 1 quart; mix, and give at one dose.

Abortion.

I have a fine Jersey cow, three years old last August; July 8th, 1901, she had a calf. She has aborted three times since; bred her again last week; she carries her calves about five months.
Rochester, Minn. A. T. S.

ANSWER.

You should not breed the cow for at least six months, in order to give nature a chance to repair the weakened parts within. The following tonic will hasten repair: Powdered gentian root and dried sulphate of iron, of each four ounces; mix, and give a teaspoonful in food once or twice daily.

Crude Oil Causes Sores.

Some calves were turned in wood pasture in the spring and fed some, but the ticks nearly ate them up. Range cattle ran in it the year before and I enclosed it. I tried every thing; the last was crude oil, which did not kill them for a while, but when the ticks left, their hide got so thick and rough that it cracked, and has taken all the ambition out of two of them. The bull is the worst.
Citronelle, Ala. L. R.

ANSWER.

It is best not to apply anything irritating at all; kerosene is not indicated; best wash off with soap and rain water, and if skin is very dry, apply a little lard to soften and soothe the parts.

Cow Growing Blind.

I have a cow 6 years old which is almost blind. It has been coming on her for nearly 2 years. She can tell light from darkness and can see objects which are some distance away from her, but cannot see things close by. Her eyes look all right and any one would not know but that she could see all right from the looks of her eyes.
Grafton, Mass. E. P. G.

ANSWER.

The causes for these conditions vary so much that it is difficult to say what may have brought about the trouble in your case. As a rule it does not pay to apply a treatment, nor are they successful.

Switching Mare.

In the issue of Jan. 30., you answer J. E. L. R., of Clair Sta., N. B., about a horse that is a bad switcher. I have a mare that has a similar habit. She catches the line and presses it down a second or two and then kicks and gives up the line. I do not understand your answer. You say "if it is a mare, the trouble may be in the clitoris, in this case the organ is amputated." Now I looked in my dictionary and half a dozen other books, including the Bible for that word clitoris and can not find it. M. S. S.

ANSWER.

If your mare is in foal, it is not safe to have her operated until she drops the foal. Then it is best to employ a competent veterinarian, who may perform the operation on the tail so that she cannot hold the lines, and she will soon get over this habit. The clitoris is the erectile female organ analogous to the penis in the male. This is sometimes inflamed and and in such a case can be amputated, which will remedy the switching evil. Your veterinarian will understand how to perform the operation, and which of the two methods to choose.

May be Lice.

Please tell me why cattle lick themselves and rub against fences more than commen this open winter. T. R. P.
Excelsior Springs, Mo.

ANSWER.

Lice may be the cause of the cattle rubbing themselves. Examine them closely and if they are lousy take 12 tablespoonfuls of Zenolum to each gallon of water and drench them to the skin. Repeat in a week. This will rid them of the lice, but you must go over the entire animal, and all of them in the herd.

BROOKSIDE STOCK FARM
HOLSTEIN-FRIESIAN CATTLE
Henry Stevens & Son, Lacona, N. Y.
offer some great bargains, to quick buyers, in 1, 2, and 3 year old heifers; also young cows and bulls.

WANTED. NO. 1 H. F. BULL Send pedigree and official records of ancestors. For Sale A No. 1 H. F Bull dropped Aug. 9, 1901. Dam and sire's dam bred by T. G. Yeomans.
Wm. O. Jackson & Sons, South Bend, Ind.

Rupture Cured Free

The Rice Method is Unparalleled in the Annals of Medical Success.

A Cheap Home Cure That Anyone Can Use Without Pain, Danger or Loss of Time From Work.

IS SENT FREE TO ALL.

To the thousands upon thousands of ruptured people who have worn trusses all their lives and have become discouraged, the Rice method will

CHIEF J. H. ALEXANDER.

prove a Godsend. Upon writing to Dr. W. S. Rice, 1824 Main St., Adams, N. Y., he will freely and gladly send you a trial of his method by mail so you can test it in your own home. Do not be backward about writing. Remember it costs you nothing to try this wonderful method.

Chief J. H. Alexander of the Detroit, Mich., Fire Department, 40 years of age, and for seven years a sufferer from rupture in its worst form, after trying every truss on the market without relief, finally decided to undergo an operation, but was persuaded to postpone it until he had tried the Dr. Rice method, with the result that he was quickly and permanently cured. He says:

"I was so badly ruptured that I feared I would have to leave the Department. In fact I did not believe anything except a surgical operation would help me. No truss did me any permanent good, but Dr. Rice's method cured me and I am today as well as ever I was in all my life. Hundreds of my associates and comrades in the Department know and can testify to my wonderful cure, and I am perfectly willing to tell my experienee for the benefit of others." Mr. Alexander's address is No. 108 20th St., Detroit, Mich.

The thousands of testimonials received by Dr. Rice mean more than such expressions usually do. A person may take a medicine and perhaps get well. He would probably recover anyway. But a rupture is a break of the muscles and there are no imaginative cures. The cure must be complete and in the face of thousands of such cures who can doubt that this wonderful Rice method will certainly and permanently cure even the worst ruptures.

MONONA FARM MADISON, WIS. Offers for sale a few well bred Holstein-Freisian Bull Calves. Also two Service Bulls at reasonable prices. The Monona Farm Herd is founded on the best stock of the De Kol, Netherland, and Clothilde families. Pense Johanna 29332 the head of the herd has 7 A. R. O. dams averaging 22 lbs. 3.7 oz. Prices and Market at the Delhi, N. Y. Creamery.

ED. HOARD'S DAIRYMAN:—Will you (unless there may be some reason why you do not wish to do so) please give me space in your columns to briefly answer the following note just received from a subscriber to your valuable paper.

For it is, it seems to me, a question of general importance and one which will I think be of interest to many of your readers.

MR. E. J. BROWNELL, Delhi, N. Y.:—I have just noticed your article in HOARD'S DAIRYMAN and wish I was near enough to look in and see what you are doing. We have been in the co-operative business 12 years, but have only made butter and used the skim milk on the farm.

Your prices are so much above our prices that I am going to ask you to give me the method you use to get these results.

Do you make butter and ship skim milk and butter milk, or do you ship whole milk, pasteurized and bottled?

We commenced in this co-operative as the first one in this part of the Elgin district and had a hard fight against a combination of creameries, who treated us as you were treated by the Borden people, only perhaps worse. We made a success and many co-operative creameries have been started around here imitating us.

Now the Borden people are putting in many condensaries and bottling plants among these creameries and can dry them up because they can only make butter to sell. We see that we will be soon in the same situation that you were in when you commenced, unless something is done to get more money out of milk than selling the butter, and are thinking of putting in a co-operative condensary; have $20,000 raised now among the farmers, for that purpose, but may conclude that we better do something else and would be very thankful if you can show us some way of handling milk that we can keep the Borden people out of here. They are now within 20 miles of us and are trying now to get in a plant 10 miles from us. M. B. R.

Bowers, Wis.

First off, I will say you seem, for I think I said nothing in the article to which you refer, to indicate that fact—to jump to the conclusion that I am personally interested in the management of the "Delhi Co-operative Creamery Co.," either as a patron or a member of the board of managers.

Now, while this is not the case, I have, since receiving your letter, shown it to the Secretary and Manager of that concern and had an interview with him, and think I am prepared to give, briefly, an intelligent answer to at least a part of your inquiries.

To your first question: "Do you make butter and ship skim milk and buttermilk, or do you ship whole milk pasteurized and bottled?

The milk is largely made up into butter and the skim milk into casein, very little of the latter being taken back by the farmers and fed upon the farm, although many believe it might thus be turned to better profit.

None of the milk is pasteurized or shipped in bottles, although the creamery is fully equipped for that work, if the conditions should indicate that it would return greater profit.

The aim of the management has been to take advantage of every available opportunity to secure the best possible prices for the product of this establishment and the success is largely attributable, no doubt, to this fact.

Being located within easy reach of the largest milk and butter markets of the country, and in a section in which is produced, probably, the best milk in this country, (for good authorities agree that nowhere else is the quality of the same amount of milk equalled as in these Delaware valleys), give us some natural advantages here that other sections may not be able to secure.

But making the best of these advantages is, without doubt, one of the key notes to the success here attained, and what has been accomplished here might, it would seem, in a large measure at least, be done in other places with proper managment.

To illustrate briefly, Mr. E. R. Harkness, the secretary and manager of this creamery, cited a few instances to which I will refer. On the morning on which I called upon him they were shipping sixty

"ADVERTISEMENT."

NEVER TOO LATE.

To Try a Good Thing.

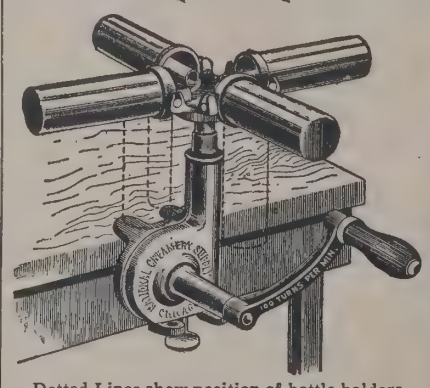
I am fifty-two years old and for forty years of that time I have been a chronic catarrh sufferer, says Mr. James Gieshing, of Allegheny City; with every change of weather my head and throat would be stuffed up with catarrhal mucus.

I could not breathe naturally through the nostrils for months together and much of the time I suffered from catarrh of the stomach. Finally my hearing began to fail and I realized something must be done.

I tried inhalers and sprays and salves which gave me temporary relief and my physician advised me to spray or douche with Peroxide of Hydrogen. But the catarrh would speedily return in a few days and I became thoroughly discouraged.

I had always been prejudiced against patent medicine, but as everything else had failed I felt justified in at least making a trial.

Our good old family physician, Dr. Ramsdell, laughed at me a little, but said if I was determined to try patent medicines, he would advise me to begin with Stuart's Catarrh Tablets because he knew what they contained and he had heard of several remarkable cures resulting from their use, and furthermore that they were perfectly safe containing no cocaine or opiates.



The next day I bought a fifty cent box at a drug store, carried it in my pocket, and four or five times a day I would take a tablet; in less than a week I felt a marked improvement which continued, until at this time I am entirely free from any trace of catarrh.

My head is clear, my throat free from irritation, my hearing is as good as it ever was and I feel that I cannot say enough in praise of Stuart's Catarrh Tablets.

These tablets contain extract of Eucalyptus bark, blood root and other valuable antiseptics combined in pleasant tablet form, and it is safe to say that Stuart's Catarrh Tablets are far superior in convenience, safety and effectiveness to the antiquated treatment by inhalers, sprays and douches.

They are sold by druggists everywhere in the United States and Canada.

NATIONAL
Babcock Milk Tester

Dotted Lines show position of bottle holders when not in motion.

Has enclosed cut gears.
Swinging bottle-holders.
Runs without jar.
As well made as a cream separator.
Best tester for dairymen ever made.

The weight of machine when boxed, approximately 11 lbs.

DOES YOUR DAIRY PAY?

It costs no more to feed a profitable than an unprofitable cow.

We want to send you an *Eclipse Cream Separator* to try. It is built double strength all through and will last and work perfectly for a life-time. It acts twice on the milk and **skims it absolutely clean.** Its interior device is simple, easy to wash and to operate. Its double process removes filth from the milk as well as separating the cream, and leaves both pure and sweet and fresh. It never gets out of order. It is guaranteed.

It's a money maker and a money saver. It operates by hand, foot or motor power.

C. L. CHAPMAN CREAM SEPARATOR WORKS, ERIE, PA.

cans of milk at what, as he said might be called an exhorbitant rate, but did not know whether the order would be continued or for how long a time.

The day previous a firm in the city wired them if they could supply them with that amount and at what price.

He wired in reply, making a price that that he, himself, considered it almost exhorbitant and that he would ship the amount the following day, unless ordered not to do so, and receiving no word shipped the milk at the rate fixed.

So, also on various occasions he had had an opportunity to sell a large amount of buttermilk at a high price, even receiving as high as 75 cents per can for that by-product in some instances, and taking advantage of all these chances, has helped to swell the gross receipts. Whether you are in a position to thus secure the benefit of extra demands of the market, for much or any of your product, you can best judge for yourself, but I think I have said enough to show how to some extent, the large prices shown have been here obtained.

E. J. BROWNELL.

Delhi, N Y

Returns from the First Year's Alfalfa Seeding.

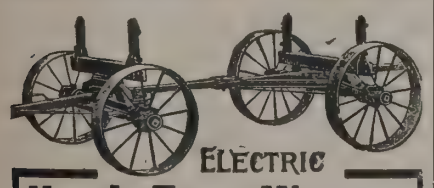
ED. HOARD'S DAIRYMAN:—I have a piece of river bottom land rented. The owner wants me to seed it to alfalfa this spring by itself, without a nurse crop. Could I get enough hay from it the first year to pay me for my work and the rent of the land?

Sometimes my butter has a strong taste in the winter. Would the Lactic Ferment I see advertised prevent it?

Bowling Green, Ky. C. L. D.

The first year's returns from alfalfa are usually small as it takes one season for the plant to become thoroughly rooted and a producer, and it is doubtful if the returns would pay for the cost of seed and preparation of the land.

It would depend on the treatment of the cream. If the cream is kept for a number of days before churning and has already taken on the flavor complained of, the lactic ferment would do no good, but if the cream is churned daily the use of a starter might help the flavor of the butter.



Handling Manure.

ED. HOARD'S DAIRYMAN:—In connection with the discussion by Norman Brown and others as to the advisability of spreading manure as fast as made, I would like to call attention to an experiment, which is being conducted by the Hatch Experiment Station at Amherst, Mass. In this experiment a moderately sloping field was divided into five plots and each plot sub-divided into two equal parts, one-half being manured broadcast from wagon or sled, and on the other half an equal number of loads are put into a large, carefully made pile. These heaps are spread in spring and then planted to corn or millet.

Results thus far show a decided increase in crop on the halves treated with manure piled and spread in spring, over the other half of plot, manure spread at time of hauling.

I was a student in the winter course, 1902, at the Massachusetts College, and Prof. Brooks spoke strongly against spreading manure as it accumulates and allowing it to lie on the surface till spring, and I am sure any one interested in this experiment will find himself repaid if he will write to Prof. W. P. Brooks or the Hatch Experiment Station for further particulars. LEON LITCHFIELD.

Cream SEPARATORS

All about them and other things for the dairy and creamery.
A. H. REID, - Philadelphia, Penn.

Early Ripe Fodder Corn.

This corn has leaped with one wild bound into popularity and nothing that we have ever sold has given such great satisfaction. Everywhere throughout the United States, where SALZER'S EARLY RIPE FODDER CORN was planted, it surprized and delighted, and pleased and astonished the grower.

It Was Ripe in 60 Days

and furnished magnificent feeding Corn just at a time when farmers were short of Corn. If you plant this early, you will have fine feeding Corn by July, when you can replant same and have good Fodder Corn in September. This is the most wonderful Ensilage Fodder Corn in the world. Our catalog gives full description.

Salzer's Superior Fodder Corn.

This variety is late, but it's the greatest Fodder Corn on earth. Here are two testimonials from wide-awake farmers that will tell you what they think of this remarkable Fodder Corn. It is far ahead of such varieties as B. and W. corn, when big ears, full ears, and lots of them, together with enormous quantities of leafy, rich Fodder are desired:

Chas. E. Brandel, Truesdell, Kenosha county, Wis., says: "The Salzer Superior Fodder Corn that I got from you last spring is truly a great and wonderful Corn. I planted it the latter part of June and some of it nearly ripened before the early frosts. There are two big ears on almost every stalk, and if it had been planted earlier, there would have been magnificent Corn, thoroughly ripened."

"Racine, Wis., Sept. 14—Out on my farm we planted nearly five acres of your Salzer's Superior Fodder Corn, and it is a sight. From one square rod we cut and bound 450 lbs., and this, I believe, is at the rate of 36 tons (72,000 lbs.) per acre.—C. C. Beebe."

OTHER FODDER PLANTS. Salzer's Catalogue is brim full of rare Fodder plants for the dairy. There is nothing in the world better than Salzer's Teosinte, yielding 100 tons of green Fodder per acre, Salzer's Billion Dollar grass, with its 12 tons per acre, and Salzer's Thousand Headed Kale, Dwarf Victoria Rape, Bromus Inermis, Kaffir Corn, Sand Vetch, Jerusalem Corn and the Giant Spurry are but a few of the things found in Salzer's Catalogue.

FOR 8c. If you will mention HOARD'S DAIRYMAN when you write, we will send you a sample package of the Earliest Ripe Fodder Corn and Salzer's Superior Fodder Corn, the two best Fodder Corns on earth, together with our great Catalogue, well worth $100.00 to the wide-awake dairyman and farmer.

is so good and works so well that we don't ask you to buy it before you try it. Entirely automatic; certain in results. May we send you one on trial? Catalogue free.

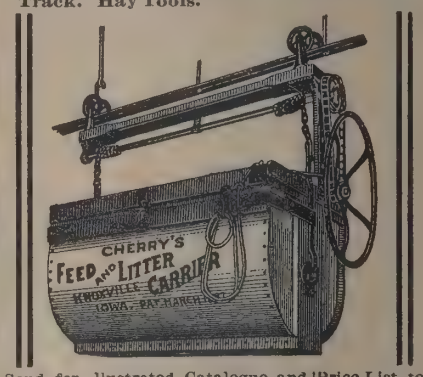
ROYAL INCUBATOR COMPANY,
Dep. 424, Des Moines, Ia.

GREAT POULTRY BOOK FREE...

Those of our people who are interested in poultry for profit should send for a free copy of the new 1903 book (No. 70) **"How to Make Money with Poultry and Incubators,"** published by the Cyphers Incubator Company, Buffalo, N.Y. The greatest recommendation we can give this book is that it is the best thing the Cyphers Company has published. It consists of 196 pages, 8x11 ins.—contains 12 special chapters, covering the subject of Profitable Poultry keeping as follows; Starting with Incubators. Handling Chicks in Brooders. Feeding Chicks. Duck Producing on Large Scale. Broiler Raising. Profitable Egg Farming. Egg Poultry Combination. Egg and Fruit Farming. Scratching-Shed House Plans. Incubator Cellar and Brooding House Plans. Feeding for Eggs. Standard Bred Poultry. Each subject handled by an expert. 300 photographic views of largest poultry plants in United States, England, Germany, New Zealand and South America. Most valuable book of the kind ever issued. Write to-day for free copy and judge for yourself. Sixty pages devoted to complete illustrated description of Cyphers Non-Moisture Incubators, Apartment Brooders, Poultry Foods and Clover Products.

THE ANTI-CATTLE FIGHTER AND SAFETY COW HALTER

Is now on the market. After three years experience with it on our cows we feel safe in recommending it to our brother farmers and dairymen as a **SUCCESS.** For bossy and butting cattle and for those given to pushing gates and fences down with their heads there is nothing in use like it. Send for circular and price list.



C. W. FORD, Williams St. Dairy, Findlay, Ohio.

THE DREW ELEVATED CARRIER
is the cheapest and most practical device for taking away manure from stables, carrying ensilage, feed, grain, etc., etc. No trouble to put them up; no trick to work them; leaves barn yard free from posts; dump in yard or on wagon; turns curves and switches. An inexpensive money saver. Write for illustrated catalogue and full particulars.

SAVE YOUR KITCHEN GREASE

Easy and quick is soap-making with

BANNER LYE

With one can—10 cents—you can make ten pounds of pure hard soap or twenty gallons of soft soap in ten minutes.

No boiling, no large kettles required.

Dissolve a can of **Banner Lye** in 3½ pints of cold water. Melt 5¼ pints of clean grease. When cool, pour the **Banner Lye** water into the grease, and stir for a few minutes.

This will make better soap than you can buy. Send for our free book,

"Uses of Banner Lye"

It is full of information of interest and value to farmers, dairymen and housekeepers.

Any storekeeper can sell you BANNER LYE. If he hasn't it, he can get it quickly of his wholesaler.

Keep the Cream Sweet two Weeks.

What a Maine Dairyman Learned by Reading.

ED. HOARD'S DAIRYMAN: We are making about 1000 half pint jars of cream a week and send the same every day to Massachusetts, price 11 cents a jar.

We have adopted H. B. Gurler's method of milking through absorbent cotton. The cream will keep sweet two weeks in a temperature of 50 degrees. Our herd consists of 40 cows and heifers. We use the model stall with partitions between and the cows are fastened with a rope across the stall behind.

CHAS. S. POPE.

Manchester, Me.

Canadian Testimony.

ED. HOARD'S DAIRYMAN:—I do not like to miss a single copy of the DAIRYMAN. I am interested in dairying and your paper is a money maker for me. Through its teachings I was induced to try alfalfa, even though some of your correspondents write that they would not think we can grow it so far north.

FRANK WEBSTER.

Cambray, Ont.

It will be noticed that Mr. Webster is not one of those readers of the DAIRYMAN, who thinks the paper is not adapted to his use because it is published in another state. There is something queer about this. We wonder if it is in the man. We shall be very glad to have Mr. Webster write us concerning his experience in growing alfalfa in Canada.

THE FOUR METALS MINING & MILLING COMPANY

ARE MINING GOLD, COPPER, SILVER AND LEAD IN FOUR GREAT MINERAL STATES, ARIZONA, COLORADO, NEW MEXICO AND WYOMING

To you this means FOUR fortunes in one. We have four times the opportunity others have. We are offering you an investment four times better than any other.

The Four Metals Mining and Milling Company owns and controls 483½ acres of some of the richest Copper, Gold, Silver and Lead mining property in the United States to-day. They have been extensively developed, and thousands of dollars have been expended. **Our Gold property has produced $100,000 up to date, and is still producing.** Our Copper properties have shipped several car loads of ore, and over $500,000 worth of ore of every grade of richness is ready to be taken out and shipped as soon as the proper machinery has been installed. All we need on our Silver and Lead property is a 100-ton mill to make it also a large paying mine. Our properties are surrounded by and lie adjoining to many great million-dollar mines.

The Entire Management will Bear the Most Searching Investigation

OFFICERS and DIRECTORS

President—J. R. MCKINNIE, President of the *Exchange National Bank*, Colorado Springs, Colo.

Vice President—W. P. GARRISON, President of The Illinois-Colorado O. G. & C. Co., Chicago.

Secretary—A. D. AITKEN, Member of Colorado Springs Mining Stock Exchange Association, Chicago.

Treasurer—E. C. SHARER, Secretary of Pike's Peak Coal Company, Colorado Springs, Colo.

Director—M. W. SAVAGE, Proprietor *International Stock Food Company* of Minneapolis, Minn.

Director—HON. L. L. AITKEN, Member of Colorado State Legislature, Colorado Springs, Colo.

The following table shows what you can get for your money before March 14th:

$900 will buy 6000 shares, par value $6000
$600 will buy 4000 shares, par value $4000
$300 will buy 2000 shares, par value $2000
$150 will buy 1000 shares, par value $1000
$ 75 will buy 500 shares, par value $ 500
$ 30 will buy 200 shares, par value $ 200
$ 15 will buy 100 shares, par value $ 100

If you desire you can purchase the above on the installment plan. 25% cash with your order, 25% to be paid in 30 days, and the balance, 50%, in 60 days. **The larger your investment the larger your returns.** Note what you might have made in the following companies:

$ 50 invested in Le Roi in 1896, now $8000
$100 invested in United Verde, now $150000
Above are only two examples out of hundreds.

WE SHALL PAY DIVIDENDS. Our stock will advance in price at least 400% within the next six months. We are offering you the chance of a lifetime. A postal card will bring to you our prospectus, with convincing proofs that our proposition is the best on the market to-day. If you have not time to investigate, send in your order at once, and investigate afterwards, and if not satisfied with your investigation, we will return you your money. All orders dated on or before March 14th will receive shares at the 15c rate. ACT QUICKLY. Address

ANDREW D. AITKEN, SECRETARY
THE FOUR METALS MINING & MILLING COMPANY
1518 UNITY BUILDING, CHICAGO, ILL.

Butter is Exposed

to many contaminating odors in commission houses and shops before it reaches the consumer. If the creameryman will wrap every pound print separately in

Pioneer Brand

Parchment Paper

he will shut out all foreign odors and taints and preserve its purity, sweetness and flavor. He will be safeguarding his brand in the best butter protector known. **Pioneer Parchment** is a **pure vegetable** parchment—not an imitation. It is tougher and stronger when wet than when dry. It imparts no taste or smell to the butter for the very good reason that it does not have either. You ought to have your name or brand printed on every package you sell. If you really make good butter, that is your most effective means of getting a reputation for it. We know how to do that printing so that it will not rub off or discolor the butter—print what you want. Our free samples of parchment paper are most convincing of their great worth to the butter maker. Write and ask for them. And our free book, **"Better Butter"** will interest and instruct you. Ask for it too.

THE PATERSON PARCHMENT PAPER COMPANY.
No. 87 8th Street, Passaic, N. J.

THE PATERSON PARCHMENT PAPER CO. PASSAIC, N.J. TRADE-MARK REGISTERED PIONEER

307 Third Street, Wausau, Wis.

Weight

Salt that makes weight makes money for the butter maker. DIAMOND CRYSTAL SALT—*"the Salt that's ALL Salt,"* made weight for one creamery at the rate of $8,000 a year in additional profit. The secret is simply this: Whatever weight you add in DIAMOND CRYSTAL SALT, *you obtain in increased weight of butter.* Its pure, dry flakes dissolve completely and become a part of the butter, instead of being washed out, or adhering to the worker rolls, like common, gritty, flinty salt. Our illustrated booklet "Just Salt" is just the thing for dairymen. Free on request.

DIAMOND CRYSTAL SALT CO., ST. CLAIR, MICH.

WORCESTER SALT
IS THE BEST

The largest Creamery in the world uses WORCESTER SALT, and—this telegram tells the rest:

"Kansas City, Mo., March 7, 1902.

For particulars address **J. H. MYERS,** C 100, Mack Block, Milwaukee, Wis.

A Washington Cow Census.

ED. HOARD'S DAIRYMAN:—I have taken a cow census in our immediate neighborhood. This is the result:

Dairyman No 1 feeds 45 cows an average of about 30 lbs. of beets and what hay (timothy) the cows will eat (probably 25 or 30 lbs.), no grain. No dairy papers. Gets 90 gallons milk per day; sells milk to condensary at $1.45 per 100 pounds. Protein in this ration, about 1.20 lbs., carbohydrates (not including fat) about 15 lbs., (as these are large cows I assume that they eat 30 lbs. hay); 17 lbs. milk per cow, per day.

No. 2. Feeds 21 cows 8 quarts shorts (ground bran) and timothy hay, no roots. Gets 36 gallons; sells to condensary at 11 cents per gallon, for the year, without test. Protein, 1.70 lbs.; carbohydrates, 16 lbs; 15 lbs. milk per cow, per day. No dairy papers.

No 3. Feeds 13 cows 25 lbs. potatoes and timothy hay (very little clover in it), no grain. Gets 18 gallons; sells to condensory at about 15 cts. per gallon for 4 per cent milk. Protein, .93 lbs.; carbohydrates, 15.5 lbs.; 12 lbs. milk per cow, per day. No dairy papers.

No 4. Feeds 42 cows 20 lbs. beets, 3 lbs. shorts and timothy hay. Takes milk to local creamery, gets 10 per cent overrun and pays 3 cents for making and selling butter; gets skim milk back. Protein, 1.06 lbs.; carbohydrates, 14.9 lbs.; 16 lbs. milk per cow, per day. No dairy papers.

No. 5. Feeds about 13 full-blood Jerseys bran and shorts and immature and frosted corn silage; no hay. Pays $40 per month for man, $50 per month for mill feed, and gets about $60 and skim-milk from creamery. Silage thrown in. Reads dairy papers and is well posted.

No 6. Feeds 13 cows (grade Jerseys) 30 lbs. pea and oat silage, 12 lbs. roots, 12 lbs. alfalfa, 6 lbs mixed hay; at a total cost of about 21 cents per cow. There are in this herd only 4 cows in full milk, 5 strippers (being carried over for fall cows) and 4 heifers. Gets about 23 gallons. Has separator run by bull; takes cream to creamery. Receipts from creamery for Dec. $107. Protein, 2.64 lbs.; carbohydrates, (no fat) 14 lbs.; 15 lbs. milk, per cow, per day. Reads dairy papers.

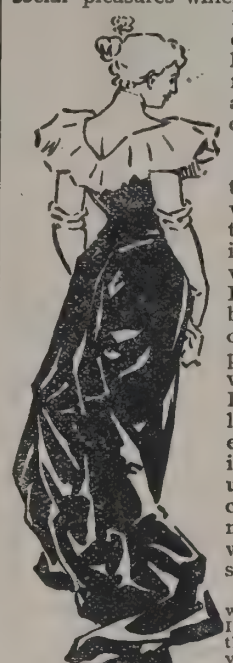
Now can you explain what the protein content of these feeds has to do with the milk yield. Also how to calculate the relative value of feeds. For instance, when shorts are worth $20 per ton, what is skim milk worth for hogs? Also what are potatoes worth as feeds for hogs and cows?

Now please don't tell us that milk is worth half as much as a bushel of corn, for we don't know anything about corn here. Have Principles and Practices of Stock Feeding by Vermont Station, but can't make much out of this method when roots or milk are compared with grain, etc. It seems to me that the results will be anything but accurate.

Sumner, Wash. W. J. L.

The facts given are both too few and too scattering to justify drawing conclusions as to the value of protein in a ration. Those who fed a small amount of protein might have done much better had they fed protein more liberally, and No. 6, who fed an excess of protein had some cows too far advanced in lactation and others too young, to permit expectation of large returns. No. 5 fed both poorly and expensively. He should have had some clover or alfalfa hay to help out the inferior silage, and then feed only about half as much bran and shorts.

Skim milk by itself alone is not a particularly valuable feed except for calves, but has a markedly beneficial effect when combined with wheat middlings and fed to thrifty pigs in the proportion of 3 to 5 lbs. milk to each pound of middlings. Used in this way, with middlings at $20 per ton, skim milk is worth not less than 25 cents for 100 lbs. As the proportion of skim milk is increased, its effective feeding value is decreased.



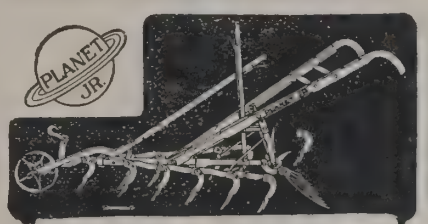
The Manure Question Reviewed.

A Veteran Wisconsin Dairyman Contributes to its Solution.

ED. HOARD'S DAIRYMAN:—The manure question repeatedly argued in the DAIRYMAN, is certainly one of the most

The Price of Pleasure.

It is hard for a lovely woman to forego the pleasures of the life which she was created to enjoy and adorn. She may have to be busy all day in office or in store, yet she cannot deny herself the social pleasures which are offered her.



But the fatigue is often too great for her, and she suffers from headache and backache as a consequence of over-exertion.

Women who are tired and worn out will find a perfect tonic and nervine in Dr. Pierce's Favorite Prescription. It cures headache, backache and the other aches and pains to which women are subject. It establishes regularity, dries weakening drains, heals inflammation and ulceration, and cures female weakness. It makes weak women strong and sick women well.

"I am so pleased with your instructions, I hardly know what thanks to give you for your kind favors," writes Mrs Milo Bryant, of Lota, Thomas Co., Ga. "I suffered so much with great pains in my back and the lower part of my stomach and palpitation of the heart, that at times I could hardly lie down. Could hardly get up in the morning, but after using three bottles of 'Favorite Prescription' and two vials of Dr. Pierce's Pleasant Pellets, I am like a new woman."

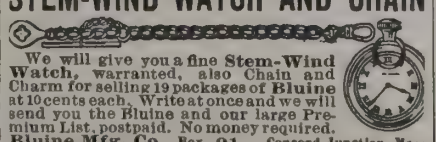
Sick women, especially those suffering from diseases of long standing, are invited to consult Dr. Pierce, by letter, *free*. All correspondence is held as strictly private and sacredly confidential. Address Dr. R. V. Pierce, Buffalo, N. Y.

RUPTURE CURED while you work You pay $4 when cured. N cure, no pay. ALEX. SPEIRS, Box 846, Westbrook M

The "Planet Jr." 12 Tooth Harrow, Cultivator and Pulverizer

shown above, is the special friend of the strawberry grower, market gardener and trucker. It is scarcely less highly appreciated by the general farmer who likes clean growing crops and thorough cultivation. The twelve teeth may be set at two angles, and with the aid of the upright lever which expands or closes the harrow to fit any width of row, makes a clean sweep of the space at one passage. No weed can withstand such thorough stirring and mixing of the soil. The long lever operates the wheel and controls the working depth perfectly. The pulverizer behind passes over all and smooths, crushes and levels the whole. The fatal "root pruning" is avoided and fine surface cultivation

Planet Jr.



assured. Being made entirely of the best material, it will last indefinitely.

The No. 25 "Planet Jr." Combined Hill and Drill Seeder, etc., as below, is shown here to let us remind you that we are the largest makers in the world of hand, garden, seeding and cultivating implements, including plain and combined Seed Sowers, Wheel Hoes, Hand Cultivators, Walking Cultivators and One and Two-Horse Riding Cultivators, Special Sugar Beet Tools, etc. Our new 1903 catalogue is beautiful and instructive. It contains over 100 illustrations with full descriptions and prices. It costs you nothing and will make you money. Write for it.

THE WEAR OF RUBBER BOOTS AND SHOES DEPENDS UPON THE RUBBER IN THEM.

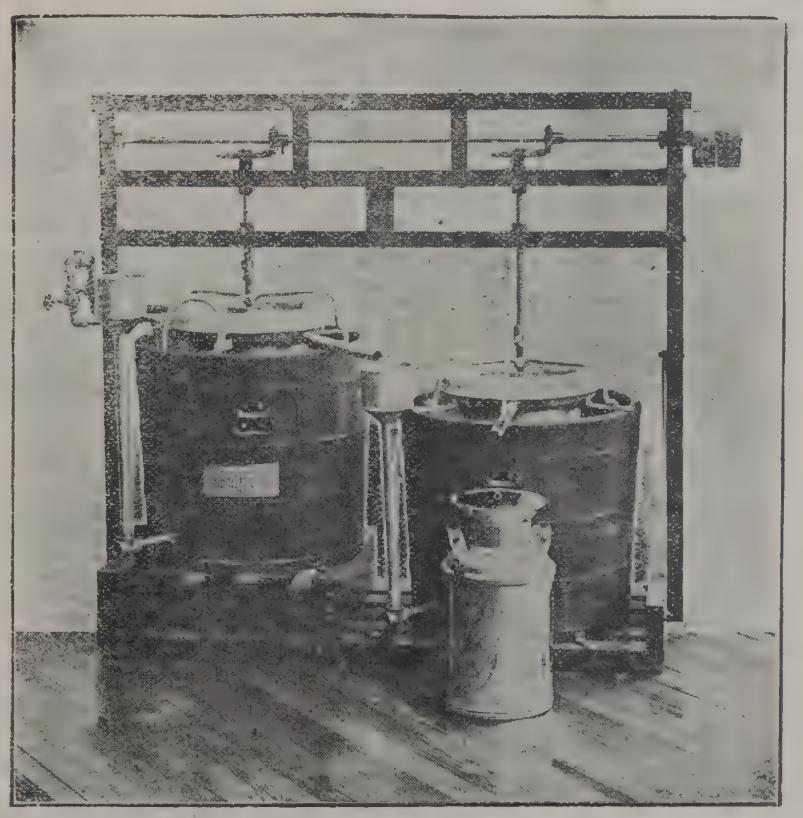
There is absolutely no wear in any of the other ingredients of which they are composed. Every time the quality of Rubber Boots and Shoes is reduced 10 per cent., the durability is reduced over 20 per cent. because there is only one way to cheapen them, and that is to leave out Rubber and put in its place other things that have no wearing quality whatever. This cheapening process has been steadily going on for the past 40 years.

THE BUCKSKIN BRAND

OF RUBBER BOOTS AND SHOES

are made of real rubber—and one pair of them will outwear two pairs of the standard first grades now on the market. Try a pair and be convinced. Made in Duck Boots, Duck rolled edge Overs for Socks, and Felt Boots and in Arctics and light rubber shoes.

Insist on getting the BUCKSKIN BRAND. None genuine without the word BUCKSKIN on the top front of the legs of the boots and the bottoms of the shoes. If your dealer does not keep them write us and we will see that you get them either through some dealer in your town or from us direct. We will also send you a very interesting catalogue profusely illustrated, which describes the making of Rubber Boots and Shoes from the gathering of the rubber to the finished goods.



MONARCH RUBBER CO.,
730 Bittner St., ST. LOUIS, MO.

NOT MADE BY A TRUST.

An actual test of a 2-inch strip cut from the sole of the Buckskin Boot. Note the elasticity and strength Only the best Rubber will stand a test like this. Weight of boy and swing 110 lbs.

A GREAT SUCCESS.

The Miller Cream Pasteurizer has a capacity of from 450 to 600 lbs. per hour.

Price $150 in Tin. $200 in Copper.

THE MILLER PASTEURIZING MACHINE CO.
CANTON, OHIO.

important questions the farmer has to deal with, and I am always glad to read anything concerning the matter, but I was somewhat surprised at the teaching and arguments made by a N. Y. gentleman in an article entitled, "Note and Comment," in the issue of Feb. 20.

I fully agree with Mr. Kelly, who holds that the loss of manural values Mr. Plato suspected took place, when he saw the colored ice, were only imaginary, for it takes so little of this liquid to taint a vast amount of ice or water, that let it be as it may, tannin or the genuine liquid, the loss is only trifling in comparison to the loss when manure is left any length of time in a heap in the yard, subject to heating and leaching.

I will confess that years ago, there was a time that I was a firm believer of Mr. Plato's theory, that I would not dare to haul manure on frozen ground; but when one of my neighbors, in a case of necessity, hauled manure on his meadow on the slope of a hill in the winter, and I watched eagerly for the results the coming summer, and then saw the luxurious growth of grass only extended as far as the manure went, my theory was upset.

I also cannot agree with what Mr. Plato says about humus. I can not see the difference whether this decaying process of vegetable matter takes place on top of the soil, or in the soil, as long as we have the humus in the land, and with all my experience, I am fully convinced that there is no place on the farm, where the manure is applied to greater advantage than on growing grasses. There it will turn to humus, and will help to make a good sod, and when a good sod is turned under, it means humus.

At last, but not least, comes in another question in connection with the manure question, namely: the labor question, and we must not only ask when should we haul the manure, but more so, when can we haul it. In my case it would simply be impossible to haul all the manure accumulated during the winter, and do all the plowing, sowing and planting at the same time, without hiring extra help. Now with us, in this part of the country, it is often utterly impossible to secure this extra help, consequently the result would be that the manure could not be hauled at all. Then what about the losses?

Wisconsin.

Michigan Educational Butter Contest.

ED. HOARD'S DAIRYMAN:—Michigan will have a six months' educational butter scoring contest, beginning with May next and continuing through the month of October. Much enthusiasm is shown over this proposed educational feature in butter making, and we believe nearly every Michigan butter maker will be represented in it.

In view of the large number of private dairymen in the northern part of the state, it was deemed well, also, to admit dairy butter in this contest. The dairy and creamery butter will, however, be kept entirely distinct from each other, each being placed in a class by itself. Diplomas will be issued at the close of the contest to the third having received the highest score. The three highest in each class will have the rank indicated in the diplomas.

The Governor of the state has very generously offered two gold medals, one to the person receiving the highest average score in the creamery class, and one to the person receiving the highest average score in the dairy class.

The State Board of Agriculture has also shown its interest in the work by offering $150 to be used toward paying the expenses of the judges. After each scoring a letter will be sent to each participant, in which defects in the butter are pointed out, and remedies for overcoming them suggested.

It is to be remembered, therefore, that in this educational test, the primary object is not to see who shall be the winners, but rather to offer a school in which the man with the lowest score shall receive the same, if not more benefit than the one with the highest score. And as the names of those with the lowest scores will not be known to the public, the man who has no idea of what his butter may score, should not be deterred from entering this educational test.

Those who desire to enter the contest should at once correspond with John Michels, Agricultural College, Mich.

JOHN MICHELS.

Agricultural College, Mich.

WHEN YOU NEED A RAKE

HITCH TO A

NEW CHAMPION LOCK-LEVER

YOU will thereby **escape the annoyances and expense** which your old rake caused. Champion teeth-holders are malleable and will not break; the rake head is heavy angle steel securely trussed and will not sag; and the wheels have each 16 strong, oval staggered spokes with heavy flanged tire. But more than this, you secure **greater convenience** of operation and adjustment. The teeth may be locked down or not for gathering as desired. When locked, no effort is required to hold them while gathering, and a boy may rake the heaviest hay and bunch it with the rake as well as a man. This is why it is called **a lock-lever rake.** Another convenience is the hand latch, by which the driver may change the position of the teeth on the ground without taking out bolts or pins, and as easily as he can change the tilt of the cutters on his mowing machine. Besides, the Champion has reversible ratchets and axles, providing **double life** at a single cost, and removable axle bushings in the hubs which may be easily replaced when worn. **Write for catalog** describing Champion binders, mowers and rakes, and for handsome colored calendar, sent free on request.

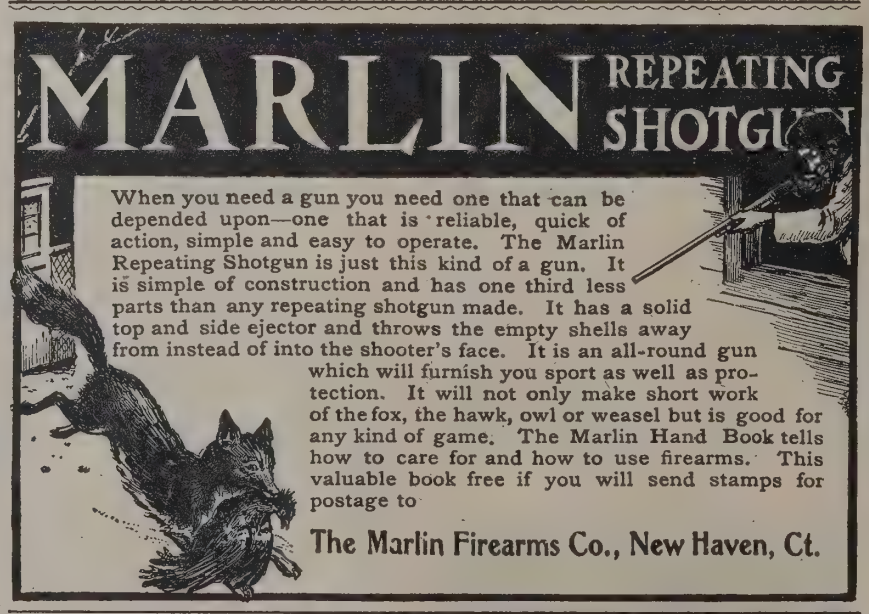
CHAMPION DIVISION, INTERNATIONAL HARVESTER COMPANY OF AMERICA, CHICAGO.

The Practical Man

appreciates the saving in wear and tear, in friction, draft and labor gained by the simplicity of

Plano Mowers

He knows the value of abolishing needless mechanism and applying power direct.



Plano's simple, automatic Clutch Shift, strong internal Drive Gear, easy-acting Vertical Lift Device and self-adjusting Draft Rod are the kind of Mower improvements that appeal to him. They are the outgrowth of experience and scientific ingenuity.

Our catalogue explains them and tells about some other interesting products of the Plano shops—Grain Binders, Headers, Reapers, Mowers, Rakes, Corn Binders, and Huskers and Shredders. The "Plano" is the Husker famed for its safe, swift and satisfactory work. Catalogue free.

MARLIN REPEATING SHOTGUN

When you need a gun you need one that can be depended upon—one that is reliable, quick of action, simple and easy to operate. The Marlin Repeating Shotgun is just this kind of a gun. It is simple of construction and has one third less parts than any repeating shotgun made. It has a solid top and side ejector and throws the empty shells away from instead of into the shooter's face. It is an all-round gun which will furnish you sport as well as protection. It will not only make short work of the fox, the hawk, owl or weasel but is good for any kind of game. The Marlin Hand Book tells how to care for and how to use firearms. This valuable book free if you will send stamps for postage to

...THE...
FARMER PROSPERS.

Success in Agriculture means prosperity for all. When the farmer prospers all classes enjoy good times. In order to prosper the farmer must keep posted in all matters pertaining to his business and secure the full margin of profit he is entitled to receive on his crops. He must keep pace with and adopt the most approved methods for cultivating and marketing his crops. The farmer cannot succeed without a practical, progressive and up-to-date farm paper. It is his best investment.

Such a Paper is

THE FARM HOME
OF SPRINGFIELD, ILLINOIS,

which contains 20 or more pages of valuable information of great interest and practical value to every farmer and each member of his family. THE FARM HOME continues to be the leading favorite with the stock feeder, the dairyman, the swine breeder, the sheep breeder, the poultryman, and the farmer interested in better home making and the education of the boys and girls.

Sample copy and rates for advertising sent on application.

THE FARM HOME
SPRINGFIELD, ILL.

Handling Manure.

ED. HOARD'S DAIRYMAN:—Several articles have been given of late in regard to manure, when to haul and spread upon the farm, methods of saving, etc. This is a subject which ought to receive more attention among dairymen, especially in a locality like this, where eight carloads of commercial fertilizer were used last year in small part of county, a dairying region and many creameries, nearly three hundred dollars paid for freight to R. R. Co., about the same amount cost of hauling from station to farms, mixing and applying to crops.

As to the time of spreading manure, no fixed rule can be established for different farmers or even one for all seasons on same farm. Last winter the ground was frozen very hard and the floods of December and March, which came without softening the soil, must have taken a large percentage of the valuable part of the manure from our sloping fields, while this winter the ground has not been frozen very hard at any time, is open and porous, in condition to receive manure containing all the liquid direct from stable.

During warm weather we endeavor to haul the manure direct to the field, but often a heavy rain will take away several dollars fertility before time will permit of securing it for the soil.

All things considered I am fully convinced that a roof to cover manure for every dairy barn is just as important in proportion to the product to be saved as a silo for the corn, or barn room for the hay; then we can spread it upon the field or not as the season or time for hauling permits.

During the summer, when not feeding from silo, we stable our cows while milking, in an enclosed shed about sixty feet long (plenty of windows on both sides) by putting a shed roof on west side, it will keep out the hot sun and also protect the manure piles. My plan is to use for the roof, boards taken from fences, which have been replaced with wire, nailing them to sticks which are spiked to plate under eaves, rafters supported by braces from timber six feet below; roof projecting eight feet; no posts to be in the way of driving close to piles.

At the northeast corner of bank barn, where cows are wintered, is a shed attached, fifty feet long and high enough to allow a shingled roof to extend twenty feet in width, which gives plenty of room for straw and granary above, with manure underneath. These plans are such as may be followed by those who do not wish to build extensively; a covered barn yard, or shed separate from barn may be better, when circumstances allow; care should always be taken not to darken or shut out sunlight from stables where cows are kept during the winter.

Land may be cheaply improved by using small fields for night pasture.

By feeding linseed meal, wheat bran and buckwheat shorts to stock kept in stables, having tight floors, using horse manure as an absorbent, if nothing better is at hand, crops may be improved and commercial fertilizer bill lessened.

Orwell, Pa. F. I. C.

Letters Regarding Coming Sales.

An Importation of Island Jerseys.

ED. HOARD'S DAIRYMAN:—Mr. F. S. Peer, well known as a breeder and importer of farm stock, landed in New York City on the 14th with 136 head of very high class stock, Jerseys, Guernseys, sheep, swine and Welch ponies. We can not have too many high class animals brought to this country. Anything that is likely to improve or strengthen the breeds in this country, should be most welcome by all. Mr. Peer has been doing good work in this line since 1891, making two and sometimes three importations a year for some of the best breeders in this country and Canada. To many of our readers, Mr. Peer is better known as the author of Soiling, Ensilage and Stable Construction, a book that has had a most extraordinary sale, having reached a seventh edition in its revised form in little over a year from the time of its publication. * *

It CURES THE HURT

Whether on domestic animals or on the human body, there is no remedy for the treatment of sores and injuries equal to

Mexican Mustang Liniment.

If the horse has barbed wire cuts, scratches, galls, stiff joints, growths, it effects a speedy cure. For cuts, ulcerations, swellings, inflammations on cows or other animals, it is equally powerful. It is the one absolutely sure cure for sore teats and caked udder in cows. Rheumatism, sprains, lame back and like ailments of mankind have no more effectual remedy. It has been

Sixty Years Before the Public,

and its popularity is ever on the increase. What other liniment can boast such a record? It is the liniment which more than any other gets right down through the skin and muscles to the deepest injury. The number of those who testify to the great healing and curative powers is legion. It has gone into all lands. **In bottles of three sizes, 25c, 50c and $1.00.** Largest size is cheapest. Sold by dealers everywhere. Write us for free booklet, "Points from a Horse Doctor's Diary."

$100 CASH PRIZE FOR ANY STUDENT OF AN AGRICULTURAL COLLEGE OR FARMER

We hereby offer $100 in cash for the best article to be written on breeding and raising Hogs. Describe ten sows that you would select for breeding. Describe boar that you would select for a cross with these sows. Describe how and what kind of grain, grains or mill stuffs you would feed sows until pigs were farrowed. Tell how many pigs you would expect from the ten sows and describe how and what you would feed sows after pigs were farrowed. State when you would commence feeding pigs and what you would use. State when you would wean pigs and what kind of feed you would give them from that time until they were six months old and what you would expect to make them weigh at the expiration of six months. State why you would expect such results from your care and kind of feed used. Describe kind of pens and yards you would use for each condition. Our aim is to have you write an article describing in a practical way just how you would raise hogs to obtain the best results. **The breed of hogs selected will Not be considered in the decision. The use of "INTERNATIONAL STOCK FOOD" will Not be considered in the decision.** The decision will be published in every leading Farm Paper in the United States and Canada. Mail your article to The American Swineherd, Chicago, Ill., on or before May 10th, 1903. **The judges will be J. W. Baynes,** editor and proprietor of **American Swineherd, Prof. Thomas Shaw** of **The Farmer,** St. Paul, Minn., and **Henry Wallace,** editor of **Wallace's Farmer,** Des Moines, Iowa. These gentlemen are well known throughout the entire country and the decision will be rendered in May, 1903. The winning article is to be our property and will be circulated throughout the world and will attract universal attention of all swine raisers. **Who will win the $100 Cash and the Honor** and at the same time write an article that will be of great practical value to every stockman? ☞ **Try for it.** ☜ **You may be the winner.** All articles must be mailed to **The American Swineherd, Chicago, Ill.,** on or before **May 10th, 1903.** Mark your envelope ☞ **"International Stock Food" Offer.** ☜

"INTERNATIONAL STOCK FOOD" ☞ 3 FEEDS FOR ONE CENT ☜ **is Prepared from Roots, Herbs, Seeds and Barks and Won the Highest Medal at Paris Exposition in 1900 as a** High-Class vegetable, medicinal preparation to be fed to stock in small amounts as an addition to the regular feed. Preserve Your Fences
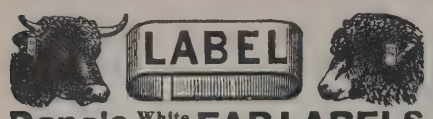
sills, planking and all other woodwork that is likely to rot, by treating with
Conservo Wood Preservative.
It will pay you to use it on every stick of timber. Costs but a few cents a stick, and saves dollars in repairs, by preventing decay. It also kills germs and insects, and foul smells. We have studied wood preservation for twenty-five years, and believe Conservo is the best preservative that can be made. We *know* it is the best now made.
Send for circular, it costs nothing, and may save much.
SAMUEL CABOT, Manufacturing Chemist, 80 Kilby St., Boston, Mass.

ACCELERATOR.



What is an Accelerator? If we were discussing cream ripening it might mean a starter---something to hasten the ripening process. But we are not talking about cream ripeners; we are talking about cream separators, **Sharples Tubular Cream Separators for factory use,** therefore we want the creameryman to think about this and get the word fixed in his mind. We will soon show him what our "accelerator" means for him, and it means a good deal. Wait.

The Sharples Tubular Dairy Separators have had an "accelerator" behind them always, and its other name is **quality.** It is **quality** that makes the demand for the **Tubular, quality** that makes the sales of the **Tubular** so far in advance of other separators; **quality** that makes the shipment of train loads of **Tubulars** possible; and **quality** that has made the **Sharples Cream Separator Works** the largest and best equipped in the world. It is **quality** that has prompted thousands of dairymen to buy **Tubulars** and that same **quality** will induce you to buy a **Tubular** if you will compare it with any other separator.

A FIFTY-ACRE ONTARIO FARM.

Mr. Isaac Bundy of Tillsonburg, Ont., writes that he has 50 acres of land on which he keeps 16 cows, 4 young cattle, 1 bull, 3 horses and 1 colt. He has two silos and seldom buys any feed except wheat bran and pea bran. He mixes these two kinds of bran and feeds about 12 lbs. per day at a cost of 10 cents. In addition he feeds a half bushel of corn silage twice a day and some clover hay twice a day. He is a milk dealer and has been delivering milk in town for over twenty years.

It follows that Mr. Bundy must be a pretty good farmer and has a pretty good farm to raise all the feed required for this stock. His rotation seems to be corn, oats and clover. The oats he cuts green and makes into hay and after cutting the first crop of clover, he uses these fields for pasture, changing back and forth every week so as to give the cows clean, fresh grass all the time.

Like other progressive farmers, he does not seem to be quite content and so makes inquiry about cow peas and other varieties of the regular pea vines. He already has 3½ acres of alfalfa seeded last spring on which, as might have been foretold, he secured a good catch. He is now drawing out cow manure and spreading it on the alfalfa and inquires how it would be to put a harrow on when the frost is out of the ground to spread the manure more evenly. He has heard somebody say at a Farmers' Institute, that manure spread on clover would smother it.

The cow pea is, in fact, a bean and its natural habitat is in the South. Some attempts have been made to grow it in some of the northern states and where all the conditions were favorable, quite good results have been attained. It is probable that this plant, like the corn plant, will adapt itself to northern climate and conditions, but at the present time we would not be justified in advising our Ontario friend to do more than try cow peas on a very limited scale indeed. It is possible that by planting a few seeds and re-planting seed from these one or two years, he might develop a variety that would just meet his conditions. Meantime, as he is anxious to add something to his present rotation that will tend to further enrichment of the soil, we suggest that he mix some of the small varieties of the Canada peas with his oats to cut for hay. He has done well, we think, in putting in some alfalfa and we do not think a light top dressing of manure will have any unfavorable effect. At all events, we are treating a portion of our alfalfa fields in this way this spring. Of course, a heavy top dressing would smother any kind of a crop. Alfalfa is a heavy producer and while it sends its roots deep into the ground to unlock the fertility beyond the reach of many other plants, it is not to be expected that it can continue to furnish large returns unless the soil has something paid back to it.

In a postscript to his letter Mr. Bundy says, "I raise three times as much feed and keep three times as much stock as my neighbor does from 200 acres, and make more money." He also says, "I have been a subscriber to HOARD'S DAIRYMAN for two years and am delighted with it. Have learned so much from it that I would not like now to do without it for twice the price."

If a dairyman, as successful as Mr. Bundy has been and is, can obtain so much benefit from reading a dairy paper, how it it that other dairymen who are not so successful, can afford to deny themselves such opportunities for improving their condition.

AN indication of how a business man looks on the alfalfa question is furnished by Mr. Scully, who is the owner of some 100,000 acres of land scattered over several states of the middle west. In leasing this land, there is a provision calling for the seeding of 20 per cent of the leased land in alfalfa. The idea is, that even in times of severe drouth the alfalfa will supply hay enough to pay the rent of the farm. How many farmers are looking as far ahead as the above landlord?

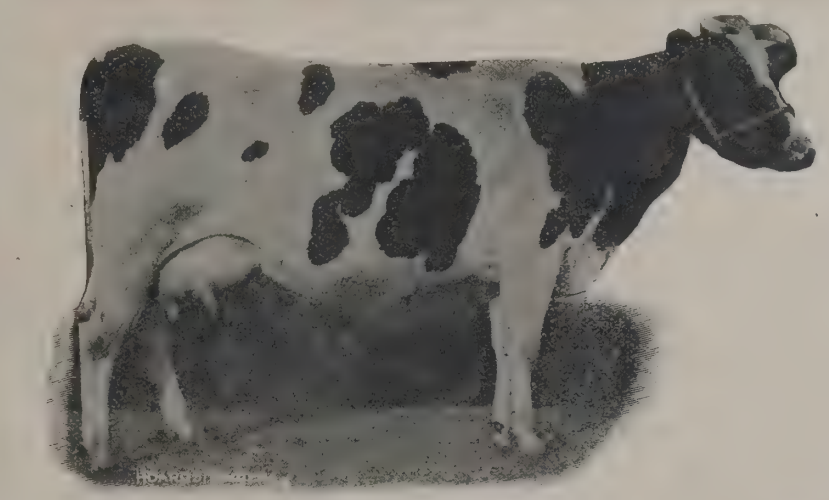
WISCONSIN BUTTERMAKERS' MEETING.

The Wisconsin Buttermakers' Association held their second annual meeting, at Waukesha, Feb. 24-27

The first meeting, that of last year, was somewhat in the nature of an experiment, it being uncertain to what extent the buttermakers of the state would support such an association, although the necessity for it was evident.

The second meeting has shown that the association has passed beyond the experimental stage, and that its future is assured. The association was fortunate in starting out with a set of officers who were both conservative and experienced in handling matters of this kind, and there is no doubt that the success of the association is largely due to the labors of President Fulmer and Secretary Farrington. In closing his report, Secretary Farrington said that at the last meeting of the officers it was decided to ask the legislature for an annual appropriation of $1,500 for the purpose of meeting the expenses of the annual meetings, printing reports, and to aid in promoting the dairy industry. A bill for this purpose has been introduced in the legislature, and each member of the association was urged to use his influence to have the bill become a law.

It is to be hoped that the representatives at Madison will recognize the value of the work of such an association, and give them the desired aid; the dairy industry of the state is a source of great wealth, and it should certainly have the needed assistance to enable it to compete with neighboring states that are making every effort to improve their output of dairy products.



President F. B. Fulmer in his address praised the progress of the association and urged the enrollment of more members. He urged members to work for the passage of the bill appropriating a sum to the association. He said in part:

"The creamery industry in general has had a prosperous year. Prices for butter have averaged higher than for some years past. New and successful creameries have been established, and older ones have increased their output. This is due largely to increased production, and not to enlarged territory. There seems to be general, practical knowledge permeating the ranks of actual producers as well as the manufacturer of milk products.

"The success of our organization depends upon judicious and timely business management, and then upon the interest manifested at the convention. The officers are largely responsible for the arrangement of details for the convention, and for looking after the interests of the association between the annual meetings."

Dairy and Food Commissioner, J. Q. Emery, speaking on the subject of Creamery Inspectors and alluding to the bill now before the Wisconsin Legislature increasing the force of the commission, said: "The Minnesota commission includes fourteen persons; the Michigan commission, twelve, the Province of Ontario, Canada, sixteen, and the Province Quebec fifty."

"Since the organization of the commission the dairy industry has increased threefold. In 1902 it reached a production, including all by-products, the estimated valuation of which is $55,000,000. The demands upon the commission have become correspondingly large. In addition, the commission has been charged with the enforcement of food laws covering all substances used for food or drink, the laws governing the sale of drugs, linseed oil, colored grain, impure ice, and adulterated cattle feeds. But this greatly enlarged scope and work of the commission has not been accompanied with a corresponding increase to the working force of the dairy and food commissioner.

HOLSTEIN COW, MANNETTE OF PLEDGE 2d, H. F. H. B., 39518
Property of T. A. Mitchell, Weedsport, N. Y.

"There are, in round numbers, about 2,800 creameries and cheese factories in Wisconsin. The number of creameries and cheese factories in this state is greater than in any other state of the union. These creameries and cheese factories are daily receiving milk from a multitude of patrons, who offer the milk in varied degrees of cleanliness or uncleanliness, and, consequently, in as varied sanitary or unsanitary conditions.

"This great dairy industry cannot be regarded as merely a private business enterprise. When the dairy industry offers to the public an article of food for general consumption it is a proper concern of the state that the food product thus offered her citizens be genuine, clean, unadulterated and wholesome.

"One competent, energetic person can visit and properly inspect not more than four creameries and cheese factories a week. To make his inspection efficient or effective he must spend the morning hours of each day in inspecting the milk received into the creamery or factory, for upon the quality of the milk received depends in large measure the quality of the butter or cheese product. Allowing fifty working weeks in the year one man could inspect not to exceed 200 creameries or cheese factories, yearly. This amount of work is believed to be an over estimate of what one man can accomplish. Surely no one man could do more. Now, allowing 200 creameries or cheese factories to be inspected in a year by one man it would require fourteen men to inspect once a year each of the 2,800 creameries and cheese factories in the state."

This question of a larger number of creamery inspectors is not one that Wisconsin can afford to neglect, in view of the work that is being done in other states. Wisconsin dairy products now stand among the first, but greater assistance must be given the dairy industry if they are to be kept there.

J. H. Godfrey, an instructor in the dairy school at Madison, and Prof. E. H. Farrington of Madison conducted a discussion on the subject of pasteurized butter. Mr. Godfrey stated that nearly all the foreign butter that is made, is made by this process, and that American trade is demanding it more and more every year and that it behooved Wisconsin butter men to study this subject carefully so they may stay in with the procession when all butter is made by this process. Pasteurized cream butter has the advantage over raw cream butter in the fact that after the cream is pasteurized the fermentation and germ life is checked, making the butter comparatively free from the danger of contracting a rancid odor after being packed.

Dr. Richard Fischer, a chemist of the dairy and food commission, gave an interesting talk on "The Composition and Detection of Oleomargarine." It is said that during the siege of Paris in the Franco-Prussian war, butter was not to be obtained in the city and some of the French scientists composed a substitute from animal fat, and that, Mr. Fischer stated, was the beginning of oleomargarine. He said that at the present time France consumed daily between 60,000 and 80,000 pounds of oleo. He explained the two simplest ways of detecting the product; one by boiling it, as when butter boils it makes no noise and lots of foam, and oleomargarine makes a great deal of noise and little foam. The boiled substances could also be set off to cool and the cooling oleo would form in a lump while butter will always granulate.

Prof. F. W. Woll, of Madison, spoke at length on "Butter Contests in Foreign Countries." His address was especially interesting to the butter men, as he confined his remarks principally to Denmark, which country is the generally accepted criterion among all butter producers, and Mr. Woll quoted the adage, "Do as Denmark does and you are all right," to uphold his lavish praise of the business in that country. Previous to 1870 Denmark was a great agricultural country, but the accession of a strip of the country's best farming land by Germany caused the Danes to look about for other occupations, and a medal was struck by the state in 1870 bearing the inscripton: "What is lost outside must be gained from within," and so the people took to the business of buttermaking to retrieve their lost fortunes. Although the business is hardly a century old in Denmark, it is represented by a capital of about $7,000,000, averaging $7,000 to a creamery, and 500 or 800 cows to each creamery. In drawing comparisons between Denmark and Wisconsin he said that this state supports 2,018 creameries, valued at $5,000,000 and averaging $2,400 per factory. Equipment is much more expensive in Denmark than here on account of the system of pasteurizing the cream, which the trade demands. The state, in Denmark, conducts the competitions and all creameries are notified by wire to send their sample immediately, leaving no chance for special preparation. The butter is scored by experts two days and fourteen days after its arrival. The exhibits cost the government about $10,000 annually, but as at the present time all poor grades have been practically eliminated it is considered a gilt-edge investment.

Prof. A. W. Richter, of the University at Madison, gave a practical talk on fuel and its use in the creamery, giving many valuable points on the methods of firing boilers and advice on how to handle fuel and furnaces so as to obtain the greatest heating effect from material used. He spoke very favorably of the use of peat as a fuel for creamery use.

State Creamery Inspector Moore spoke of the "Inside and Outside of Wisconsin Creameries" and urged that more attention be paid to cleanliness among the state creameries, and also gave some good advice on refrigeration and ventilation.

Prof. Oscar Erf of the Illinois Agricultural College, discussed creamery buildings and illustrated his address by the use of several charts, showing a septic tank arrangement for the disposal of sewerage on level ground locations and also the methods of construction of cement floors, creamery walls and floors and also plans for two creamery plants, complete.

One of the most important questions connected with the creamery industry was then taken up, viz: Whole milk creamery and hand separator cream.

In regard to the above, the creamery industry is in a transition state owing to the rapid introduction of hand separators among creamery patrons. In their eagerness to sell hand separators the agents are making claims and statements which cannot but result in a deterioration of the butter made from hand separator cream, if these methods continue. If there is any one place where cleanliness is an essential it is in the use of a hand separator, but many agents are teaching the buyers of their machines that the bowl requires cleaning but once every few days, or a week in some cases, and that in any case a pail of water thrown into the bowl is all that is necessary. It needs no prophet to tell the result of such teaching on the cream produced and its effect on the future of the butter industry of the state, and unless the separator agents stop appealing to the lazy side of human nature as an aid in disposing of their machines the quality of Wisconsin butter is sure to suffer and the result will be a wholesale discarding of the hand separator.

E. L. Duxbury, of Green Bay, who won the sweep-stakes gold medal at Milwaukee, described the process of making his prize butter. He said they have an ordinary creamery, locality and patrons, but he made a careful study of local conditions and made improvements wherever possible. He rejected all milk that he considered unfit for butter of the highest grade and then followed the modern dairy school teaching as to handling the cream and butter.

The following officers were elected:

President, J. G. Moore, Albion; Vice-President, W. J. Hyne, Evansville; Secretary, F. B. Fulmar, Ettrick; Treasurer, E. C. Dodge, Lake Mills.

Sweepstake gold medal was won by G. G. McIntyre, Whitewater, with score of 98.

Silver medal won by Wm. J. Hyne, Evansville, score 97½.

Following is list of scores of 90 and over:

A Stable Plan for Criticism.

ED. HOARD'S DAIRYMAN:—I would like a little information in regard to fixing my barn. It stands on a slope of about 8 or 9 feet in the length, with16-foot posts. When I got the place the east or lower end was fixed up for 6 cows and 3 horses across the end. Now, my plan is to dig out under the whole barn, which is 40×60, put a stone foundation under it and fix it up something after the plan I enclose, provided there is no serious objections to this plan. I have never seen what I considered a very handy dairy barn and whether my plan would be satisfactory after I got it done or not I am unable to say. But my reasons for standing their heads to the wall are: The hay boxes will not be in the way of the hay carrier at time of filling the hay loft, stock will not be blowing their breath in each other's faces, and then there will be room in the middle to back a manure wagon or boat in, at cleaning out time and go to the field with the manure.

If my reasons are faulty, or you can suggest anything better, give it to me for I am young at the business, but old enough in years. Tell me how I can best ventilate a barn of that kind, and about what is the cost of a good cement floor per square?

I have a spring above the barn so that I can pipe the water into the barn for stock and washing off the floor once in a while if necessary.

I am one of your short-time subscribers, but if I can raise a dollar at the expiration of my subscribtion, I shall want the DAIRYMAN to continue coming my way.

My reason for not planning my barn for more stock is, I have less than 80 acres and I expect to run to dairying exclusively, sell my calves for veal and feed the milk to the pigs. I have experimented with young stock, all I am able to. A good veal at 6 or 8 weeks old, ought to be worth $6.00 to $8.00, and when I keep them until they are a year old they have got to be pretty smooth and about the right color if I can get more than $12.00 for them, so I have come to the conclusion that young stock don't pay on a small farm. J. P. S.

Downing Wis.

We see no special objection to the plan submitted for refitting this basement stable, except that, so far as the plan shows, there is much wider space in the center than is really necessary, and we should prefer to have this extra space on the sides in front of the cattle. The central driveway for cleaning out the droppings, does not need to be more than 8 feet wide from gutter to gutter. We would make the gutters 18 inches wide, the platform of sufficient width to afford the cows standing room and for mangers, and after that take what space is left for feeding alley in front. It is not to be expected that everybody will be equally pleased with any system of arranging a stable. For ourselves, we prefer to have the cows face outward, both as a matter of convenience in caring for the animals and for further assurance against contamination.

For ventilating a barn of this character, we should use the King system, which provides for taking in fresh air at the upper part of the stable and removing the cold and foul air from the bottom. Instead of letting the fresh air come directly through the wall it is advisable to have openings outward as low down as possible, connecting with flues in the wall which lead up to the top and then turn into the stable. This prevents all possibility of the warm air escaping. Build a central stack, or ventilating shaft, about 2 feet square at or near the west end of the stable and let it run directly up through the ridge.

Cow Comfort and Discomfort.

ED. HOARD'S DAIRYMAN:—We who are interested in the dairy industry, having started in on another year, let us make it more prosperous than the one just past, not because we did not do justice to it, but because we are one year older and have added something to our store of knowledge and will profit in the future by our mistakes in the past. If we should visit some dairy sections of our country in the summer months and observe the many different methods of handling the dairy cow, we would be surprised to see that so many people still retain the idea that the cow is a machine which only needs feed, regardless of kind or quantity, to keep her in fair condition. They treat her worse than they do some of their machinery and think she is at her best.

If a good profit is not obtained, they either condemn the cow or say there is no money in dairying. The cow's system is governed by a net work of nerves similar to our own and we know that if we are kept in a nervous, excitable state, our system will sooner or later become in a poor condition, our health fails us and we can not do the work we could do under more favorable surroundings. So it is with the dairy cow. Her work is not like that of the horse and ox, but is the manufacturing of milk.

If she is kept in a pasture where there is but a small amount of good grass and when it is time to milk her, a dog, or boy on a horse, is sent after her who chases her all the way to the place of milking, she is then milked in this excitable condition, I can say from experience thathowever good a cow may be, she will not be of any profit to her owner if treated in this manner? We all know that if we are excited or angry that our food does not seem to digest as easily as when we are in the opposite. It is simply due to the glands failing to perform their duty, caused by the nerves not acting in each, so that they might perform their duty as nature intended they should. So it is with the cow when she is in an excitable condition, she should not be milked for

Getting the Milk Profit.
If you are interested in the milk business, either as dairyman or dealer, or are converting milk into any of its varied products, you should be interested in our magnificent line of
Dairy and Creamery Supplies.
Ours is the most extensive house of its kind in the West. Our line includes such standard articles as Milk Cans, Areators and Heaters, Milk Tickets and Stationery; Pails, Strainers and Dairy Tinware of all kinds, in fact a complete line of Milk Dealers' supplies. We also handle extensively Boilers, Engines, Churns, Butterworkers, Vats, etc. Amongst our specialties, manufactured solely by us, are Dairy Queen Churn, Boyd Cream Ripener, Success Skim Milk Weigher, Sturges Pasteurizer, Milk Heaters, Seamless Steel Cheese Hoops, Perfection Milk Coolers and 20 styles of Milk Cans. We are not a part of any trust, but an independent house furnishing high class supplies at a low margin of profit. The stock we carry is so varied that we publish a special appropriate catalogue for each department. Write us for anything you need in any way connected with the milk business, and we will mail you free the proper illustrated catalogue. We are sure to meet your every want and we guarantee to save you money.

her milk glands will not work well in this state. The milk is not all elaborated when we begin to milk, but is secreted by the milk glands during the milking process.

This is why we should put so much stress on trying to keep the dairy cow in as comfortable a condition as possible so that the milk glands (which are the most important at this time) can do their best, for the milk is what we keep her for. If we fail to do this, we had better not keep her, for she will only be at a loss to us. Let us try in the future to keep the dairy cow in as comfortable a condition as possible which can be done mostly without cost and see at the end of the year if your cow has not increased her profits at least 10% without 1 cent of an investment compared to other years when she was treated otherwise. LESTER STORY.

Creamery Patrons' Investigation and a New York Herd Report.

ED. HOARD'S DAIRYMAN:—I have been a reader of HOARD'S DAIRYMAN for ten years or more, and what little success I have attained in dairying I owe to its teachings.

I have been much interested in the creamery patrons' investigation going on for some time. It gives one an idea of what dairymen are doing in other localities, and I notice it matters but little about our location commercially throughout this great central west, as the prices of all our feed stuffs are nearly alike, only a little variation in the freight rates, and since the advent of the creamery the price of butter is about the same, so that we are practically all on the same level, and if one is not doing as well as his neighbor there must be something wrong about his management, either in care, feeding, or breeding and selection.

I will give you a report of my herd of cows for the last year; cows are grade Jerseys of medium size; number of cows, 19; 4 were two-year-old heifers, the other 15 were of all ages up to 14 years, commencing with October:

	Lbs. Milk.	Test.	Butter fat.	Cash.
October, 1901...	9,822	4.55	446.9	$ 93.42
November.....	10,076	4.55	458.4	110.47
December.....	12,105	4.8	581.	134.21
January, 1902...	10,880	4.4	478.7	114.40
February	9,157	4 8	439.5	123.44
March	9,144	4.9	448.	117.37
April.....	9,836	4.9	481.	119.51
May.....	9,102	4.7	427.8	90.24
June.....	7,608	4.7	357.5	70.42
July.....	4,634	4.9	227.	43.13
August.....	3,644	4.9	178.5	34.45
September.....	2,733	4.5	122.9	25.07
Total.....	98,741		4648.2	$1076.55

Average lbs. of milk	5,186
Average butter fat	244.6
Cash average returns	$56.66

For $1.00 worth of feed $1.70 returns for butter alone. Skim milk is valued for what it is worth for feeding. These prices are net at the creamery, the cost of making being deducted. I figure it cost $32.40 per cow for feed. Ration for winter was:

Corn silage 40 lbs. at $2.00 per ton	$.04
10 lbs. clover hay $6.00 per ton	.03
10 lbs. shredded corn fodder	.01¼
2½ cotton seed meal $26 per ton	.03¾
Total	$ 11½
200 days at 11½ cents per day	$23.00
165 days pasture 40 cts. per week	9.40
Total	$32.40

This winter I am feeding a different ration as I don't like to feed all cotton seed for a grain ration. Am feeding a mixture, bran, 2 lbs; cotton seed meal, 2 lbs.; gluten meal, 1½ lb. Am feeding on an average about 6 lbs. per day, some more some less; ration this winter costing 13.5 cts. per day. I don't know as the cows are doing any better. This winter the hay and silage is not of as good quality owing to the cool, wet season. Farm consists of 100 acres; cultivate 55 acres, 20 acres pasture, wood lot, 20 acres; 5 acres for yard and hog lot.

I raise five or six calves and 30 to 40 hogs every year. Keep a registered Jersey bull and am improving herd with each succeeding cross. Rotation of crops are corn, wheat and clover, raise a few acres of oats, sugar beets and potatoes and know that the fertility of the farm is increasing with this practice.

I might add that I have sometimes made 30 cents per hundred feeding skim milk to hogs. It depends on the thriftness of the hogs and the price sold for.

I wish to ask one question. Some of my cows when fresh give 30 to 40 pounds of milk per day and generally shrink to 20 to 25 pounds per day, after giving milk four or five months. I want to ask, is it possible to maintain this large yield of milk 7 or 8 months, and if so, would it be profitable to do so. F. P. P.

New York.

Resolutions of the Ohio Dairymen's Association.

WHEREAS, The Ohio Dairymen's Association in convention assembled, representing the immense dairy interests of the state, and desiring that our dairy products shall be so improved as to command better markets and more remunerative prices; and, that they be freed from a competition of deception, therefore be it

Resolved, That this Association endorses the work of the National Dairy Union in securing the passage of the national oleomargarine law, of May 9th, 1902, and, that we commend the officers of the Union and especially Mr. Charles Y. Knight, its able secretary, for their honest, persistent and loyal devotion to the dairy interests of the country.

That we commend the Hon. James Wilson, Secretary of Agriculture, for the stand taken by him upon the branding of "renovated butter," and, that we earnestly protest against any modifications of the laws and regulations that would permit the selling of renovated for pure creamery butter.

That we instruct the legislative committee of this association to secure, if possible, the passage, by our General Assembly, of such laws as may be necessary to revise and bring up to date the dairy laws of our state.

That this Association recognizes the pressing necessity of state instructors, whose duties shall be to visit dairies, creameries and cheese factories and furnish such instruction to the operators of same as will enable them to produce a better quality of milk and its products; and, that this work be respectfully commended to the Dairy and Food Commissioner, to the end, that the commission may become in fact what it is in name, a Dairy and Food Commission instead of as heretofore a Food Commission only.

That we commend the "educational test" being conducted by the N. C. B. A. in conjunction with the Agricultural Department of the National Government and urge our butter makers to enter the contest as a means of greatly improving their product and themselves as butter makers.

That we urge upon the General Assembly the necessity of enacting a law governing the analyses and branding of stock foods.

That we recommend to the Executive Committee of the N. C. B. A. the advisability of holding the 1904 convention of that Association in an eastern city; and, that we very cordially indorse the claims of Buffalo, New York for the convention.

That we endorse the candidacy of Mr. E. Sudendorf for Superintendent of the Dairy Department of the Louisiana Purchase Exposition of 1904.

That we commend the very efficient work being done by the Dairy School of the O. S. U., and respectfully recommend the appropriation of sufficient funds to properly equip the school with the much needed machinery to make it the equal of any dairy school in the country.

That the Association considers as an injustice the action of Congress in cutting down to $1,500,000 the appropriation for a building to be occupied by the United States Department of Agriculture; and that we hereby urge such additional appropriation, as may be necessary, to build a home for the department equal to its needs.

That we urge an early passage by the United States Senate, of the House bill providing for the importation of blooded and registered stock, free of duty.

That we extend the thanks of this Association to the Trusttes of the O. S. U. for the use of Townshend Hall in which to hold this convention of the Association.

That whereas, this Association has been deprived, by the death of Prof. L. F. Hickman, of the services of one of its most efficient and active members, therefore be it resolved: That we deeply deplore our loss and that we desire to bear testimony to his character and worth, and of the value of his work for this Association in its organization and early history, and that we pay this tribute to his memory by a rising vote of the Association.

"ADVERTISEMENT."

COLLEGE PROFESSORS

Talk of Foods.

The New York papers recently contained a long account of the so-called discovery of a celebrated professor in one of the leading universities. The "discovery" related to a new and successful way of treating wheat and barley to prepare the starchy part by dry baking, so it would be made more digestible and nutritious. Thereupon Prof. Livingstone commenting on the discovery of the other Professor says: "A discoverer who was a business man first and a scientist afterward found that such foods could be made more digestible when cooked with dry heat instead of by boiling in water, and has already placed on the market the food which he discovered prior to Dr.——." This refers to Grape-Nuts the most scientifically made food known. Grape-Nuts can be easily digested by babies or anyone with a weak stomach and the food contains the most powerful rebuilding element known, particularly as relates to the rebuilding of the brain and nerve centres. It is a delicious food requiring no cooking but ready for instant service just as it comes from the package A receipe book free in each package describes many delicious dishes made from Grape-Nuts.

WILL IT PAY YOU TO TAKE HOARD'S DAIRYMAN?

W. H. Jenkins took a census in 1901 of 50 farmers who were patrons of the creamery in Montrose, Pa. Twenty-five of them read dairy papers; twenty-five did not. The twenty-five who did read dairy papers averaged $50.23 per cow for the year. The twenty-five who did not read averaged $32.95. Here is a difference of $17.28 per cow. Did it pay the twenty-five to read? Did it pay the other twenty-five not to read? That's not all. Those who did read averaged a profit over cost of food of $15.06 per cow. Those who did not read averaged a profit of 66 cents. Is not that dairy farmer standing greatly in his own light who will not pay 2 cents a week for Hoard's Dairyman? These are hard facts worth thinking over.

We are receiving of late a good many requests for a bundle of copies of HOARD'S DAIRYMAN for distribution. We are very glad to forward copies for distribution, for we need the help of every reader to increase the circulation of the DAIRYMAN. Get up a club of subscribers among your neighbors. If there is going to be a meeting of the creamery or cheese factory patrons, write us for a bundle of sample copies for distribution. If you are going to a farmers' institute, have some copies with you. These meetings afford excellent opportunity to work up a good club. Write us at least a week ahead of the meeting saying how many copies you want and we will promptly forward. Give us your help.

WE have received a copy of the fourth edition of Monrad's A. B. C. of cheesemaking. That four editions of this little work have been issued, is a good commentary on its value. Besides the methods used in making Cheddar, there are also descriptions and instructions for making the less well known foreign varieties such as Gouda, Brie and Neufchatel, sour milk cheeses—cottage, schmierkase, etc. It makes an excellent hand book for those who are interested in little known varieties of European origin, but which are beginning to have a wide sale in this country. It can be obtained from this office for 50 cents post paid.

TRULY HOPEFULL.

Mr. W. F. Roberts, of the Fern Spring Farm, Riceville, Tenn., sends us the names of five of the employes of that farm, who wish to subscribe for the DAIRYMAN as Mr. Roberts says "on their own volition," at their own expense. Mr. Roberts further adds: "This gives the future a very hopeful aspect both for them and us."

When the hand that labors is guided by a brain that hungers for knowledge, it is indeed a hopeful aspect.

HOG CHOLERA.

Some of the Canadian farmers claim that the somewhat remarkable exemption from hog cholera in the Dominion, is largely due to the fact that they feed very much less corn, more peas, barley and oats. Certain it is that ten Canadians grow peas where there is one in the United States. Of course, if the farmers buy hogs reckless of where they come from, they will introduce the cholera into districts where it has never before existed, and there it will stay. This the Minnesota farmers did a few years ago, against the earnest warning that Theodore Louis gave them, and they have suffered severely on account of it. There is no doubt that the feed has a great influence in creating a condition of the physical system so that the germs of cholera take easy hold, or, to the contrary, are easily resisted.

We are unable to see why more farmers do not make larger use of the pea crop. With dairy farmers especially is the pea doubly valuable, for they apply splendidly to both cows and hogs, and it is not a difficult matter to grow them when *once* the laws of pea growth are studied. By the way, every plant has its own special law of growth. If we study these laws and conform to them, we are more apt to be successful.

INVESTIGATION IN MILK PRODUCTION.

Prof. Haecker Reports Progress.

A most notable contribution to the solution of the problem as to what becomes of the feed eaten by a dairy cow, and, as a corollary, what are the elements which should enter into her daily ration, and the proportional amounts of each, is contained in Bulletin 79 (January, 1903) of the Minnesota Agricultural Experiment Station, by Prof. T. L. Haecker, Division of Dairy Husbandry.

Ever since the formation of the dairy herd at that Station, in the fall of 1891, very complete records have been kept of the feed and yield of every cow, and from these records, tabulated and combined in various ways, Prof. Haecker discusses, in the bulletin recently issued, the following subjects:

1. The Food of Maintenance.
2. Nutrient Requirements.
3. Protein Requirements.
4. Influence of Stage of Lactation on Nutrient Requirements.

As the bulletin covers sixty solid pages, with an average of one table to each page, it is manifestly impossible to reproduce in these columns the statements of facts upon which the conclusions drawn are based. Those who wish to study the questions in detail must obtain a copy of the bulletin. Primarily, the bulletin is published for residents of the state of Minnesota, but it is probable that people residing in other states can obtain a copy by addressing Prof. T. L. Haecker, St. Anthony Park, Minnesota.

For the benefit of such of our readers, as have not the time or inclination to grapple with the statistics and arguments in detail, we give below a summary of the more important conclusions put forward:

1. The factors for food of maintenance in the Wolff feeding standard are in excess of the requirements.

2. The food of maintenance expressed in (digestible) nutrients, for a barren dry cow, when at rest in stall may be tentatively suggested to be 0.6 of a pound of protein, 6.0 pounds of carbohydrates, and 0.1 of a pound of ether extract, per 1,000 pounds live weight; or when at work in a dairy, with ordinary good care and comfortable quarters, 0.7 lb. protein, 7.0 lbs. carbohydrates and 0.1 lb. ether extract.

3. The total nutrient requirements in milk production depend (1) Upon the weight of the cow; (2) Upon the quantity of milk yielded; (3) Upon the quality of the milk; (4) Upon the age of the cow,—heifers by reason of extra feed for growth, requiring nearly 50 per cent more available nutrients to a pound of milk than mature cows.

4. Rations having a nutritive ratio of 1:7.7 (1.68 lbs. digestible protein) and 1:9.7 (1.32 lbs. digestible protein) were as effective in the production of milk, butter fat and other milk solids, as was the one having a nutritive ratio of 1:6.3 (2.04 lbs. digestible protein).

5. The protein required in milk production depends upon the quantity and quality of milk yielded; for every increase of one-tenth in the per cent of fat add .0007 pound of protein for each pound of milk.

6. A maximum yield is secured at a minimum cost of food by a proper adjustment of the amount of nutriment in the ration to the animal's needs for maintenance and for product yielded, and the bulk of the ration to its feeding capacity.

7. During the early stages of the period of lactation, cows lose rapidly in body weight, and during this period, usually lasting into the 11th week, yield dairy products, in excess of the amount provided for by the food consumed.

8. The normal net nutrient requirement per pound of butter fat is approximately 6.25 lbs. (a little less with cows giving rich milk) and per pound of total milk solids, 2.4 lbs.

It is not to be expected, and Prof. Haecker does not claim, that the last word has been written on the topics discussed. He puts forward his conclusions tentatively, subject to such modification as further experience may require. Other stations will doubtless test these conclusions—indeed have already tested them in some degree, and as far as they have gone, confirmed them. And hundreds upon hundreds of dairymen have already profited from the information thus obtained.

SMALL OR LARGE FARMS.

A young man in Illinois started in the dairy business three years ago, on a rented farm, containing 188 acres, with common cows. He is improving his herd by the use of a pure bred sire as fast as possible, and shipping milk to the city of Chicago. He has only a small and poor pasture and therefore depends largely upon soiling, with the following rotation: First, fall rye, then early barley, then oats and peas, and lastly fodder corn.

His father has a farm of 172 acres and wants the young man to give up the large farm and work his small one. It is proposed to build a first-class dairy barn and silo on the small farm and keep all the cows that the farm will carry, depending principally upon alfalfa and corn for roughage, buying bran, dried brewers grains, etc., for concentrates, and straw for bedding. He thinks that by reducing the area for pasture to a small lot and using soiling crops and silage for summer, and silage and alfalfa hay for winter, that he can make the small farm carry 40 cows.

We think the young man is right in his plan and that the small farm, well tilled in an intensive way, will yield a larger profit than the larger farm. We should depend very largely on the silo, both for winter and summer feeding, and if alfalfa proves, as we are very confident it will, well adapted to the soils and conditions of Illinois, we should depend very largely upon corn and alfalfa as the main crops, trying in a small way at first, to grow some cow peas with the corn for silage. We would have two silos, one for summer and one for winter.

It would be a most excellent education for this young man to make a visit to Mr. Gurler's farm at DeKalb, Ill. We are very certain that Mr. Gurler would be more than pleased to explain his methods and are certain that any advice that he could get from Mr. Gurler would be well worth heeding.

Eyes Opened.

An Ontario Report and Feeding Inquiry.

ED. HOARD'S DAIRYMAN:—Enclosed please find two dollars ($2.00) to extend my subscription from March 21st, another year and also to pay for a copy of The Dairyman's Hand Book.

Have been reading your paper for nearly two years and feel now as though I could not get along without it. We are living in a community where dairying is looked upon as necessarily combined with beef making to get a profit. Nearly all our farmers judge a cow as much by her appearance for producing beef making offspring, as for her ability to give profitable quantities of milk.

Our milk all goes to a cheese factory where it is pooled, and we pay 2 cents a pound for making.

Reading and studying your paper has opened my eyes considerably, both in regard to what cows should produce to be profitable and the kind of feed to raise to feed them on.

We have on hand early cut clover (which the cows eat greedily), ensilage from well eared corn, a lot of corn stover for roughage, about 1,800 lbs. bran, cost $15.00 a ton; oats worth 30 cts. and wheat worth 65 cts. a bushel for concentrates. Can get more bran at $18.00 a ton, oil meal at $35.00 a ton.

1. Would it pay to change oats for bran? Have a crusher to crush oats at home.

2. Please give a balanced ration from above, for fresh cows weighing from 900 lbs. to 1,100 lbs. These cows, 6 in number including one 2-year heifer, averaged 6,000 lbs. milk in 1901; estimated partly from weighing and partly from returns from cheese factory.

Ontario. WARREN STRINGER.

We earnestly urge this correspondent to put a set of spring balances in his stable and weigh and record the amount of milk given by each cow at each milking. There is no other way known to us by which a dairyman can definitely determine which of his cows give him best returns for the feed consumed. Every one who has tried this has found occasion to modify his judgment in regard to the paying ability of the different cows in his herd.

There is no considerable difference in the feeding value of oats and bran at the prices named. Therefore, we include both in the formula which follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
30 lbs. silage	7.92	.39	4.20	.21
10 lbs. clover	8.47	.68	3.58	.17
4 lbs. bran	3.52	.50	1.54	.12
4 lbs. oats	3.56	.33	1.89	.17
Totals	23.47	1.90	11.21	.67

Less hay and some stover might well be included in the formula, but in that event it might be necessary to increase slightly the amount of grain. The larger cows will probably require more of the coarse fodder and the larger mikers might well have more grain.

Notes from New York.

The Hay Industry.—Maple Sugar Making.

ED. HOARD'S DAIRYMAN:—We are in the midst of hay pressing, one of the big jobs with us. We have already baled 80 tons and have 10 tons of hay and 15 to 20 tons of straw yet before we are through. The weather has been rough and stormy, making many breaks between times when we could not press, lengthening it out to a rather tedious job. But "every cloud has a golden lining," and we expect to reap our reward later. This selling hay to be shipped away from the farm is a leading industry in our immediate vicinity, and the question of soil fertility in connection with it is one that is more and more asserting itself to the minds of the farmers themselves.

I have spent considerable time in studying this question from every point of view and have come to the conclusion that selling hay or milk to be made into cheese, the former is as advantageous as the latter as regards soil fertility with the possible

exception that where a dairy is kept more or less commercial feeds are purchased and added to the fertility gathered on the farm. Now, perhaps this may cause a furor and send some shivers up the backs of a certain few who read the DAIRYMAN, but human nature is weak and it is human nature the world over that when there is a fair "bite" for the cows in the aftergrowth of their meadows to turn them on and leave them there until the roots of the grass is about all that remains, leaving the plants without vitality enough to withstand the winter, and so it takes half the next growing season and all the stable manure to bring them back to the point where the cows were turned on the meadows.

Did you, readers, ever notice that on nine-tenths of the dairy farms you know there are spots where the meadows are producing rank crops of hay and all the rest of the farm the hay is light and poor. Why is it? Why the cows were kept off the new seeding and the manure was all put there, while no fertility of any name or nature was put on the other meadows. What fertility nature provided was given to the cows by an improvident husbandman, but the next year the cows roam at will over that field and the soil soon comes to the level of the rest.

Now, I don't mean to make the claim that cows are a detriment to a farm when they are handled as they should be, but in the hands of that nine-tenths of the farmers they are certainly of no advantage as regards fertility. Why, I have seen the manure from 20 cows and 3 horses spread on a three-acre plot, literally covered with manure. If that man had, as he ought to have, say, one hundred acres under cultivation it would take him 33 years to go over his farm. That plot would never see any fertilizing material again in 33 years and every bit of after feed grazed off year after year.

Readers, do any of you pursue such methods? I hope not, but if you do, change them, change them for a summer silo, or a system of soiling, or sell off the cows, get rid of them, they are a damage to your farm. We find here that the farms devoted exclusively to hay, or with very small dairies as compared to their areas, are the heaviest hay producers. Now, why is it? Their rotations are shorter, and their soil cultivation is better. They have made a study of better crops just as the dairyman should of better cows, and the result is, that with none or little fertility added to their farms, still they rank first in crop production and money value. I do not make the claim that a dairy farm cannot be kept in a higher state of fertility than one where no dairy is kept, but that in nine-tenths of the cases it isn't and is directly traceable to the bad methods of the farmer and dairyman rather than to the dairy. Again I have often thought that a dairy created idle habits.

The cheese factory, usually in some central location, calls together the patrons and forms the habit of gathering somewhere to idle away their time. Every one knows that the more one goes to the corner grocery the more they want to go and do go when there is work at home that needs their attention. The corn and potatoes are overrun with weeds, the fences are out at the elbows and the pigs are in their wives' garden patch, still they have time to swap yarns at the corner grocery. Weeds in the potatoes and a look of shiftlessness around the premises are excusable when there is a press of farm work; at any rate one does not feel so badly about it, if he has been driven with work all the time.

A farmer cannot afford to idle away his time. He must be up and at it, if he ever expects to own a home of his own and get it paid for. He should be a good farmer as well as a good dairyman in order to be a success.

I suppose that many of the readers of the DAIRYMAN have never been in a sugar bush and seen the sugar evaporated nor ever sugared off and eaten Jack wax. Well, it is quite an industry in the south part of our (Jefferson) county, and we buy our sugar from that source. Although we have probably 50 sugar maples scattered around the farm that would make all the sugar we would care for, but too much hurry and work to bother with sugar making.

Of course if we make our own sugar, we would have a better and purer grade of sugar, for sugar makers are quite apt to use considerable brown sugar in their families at this time of year, and there is quite a temptation to make 4½ cent sugar into that worth nine or ten cents a pound. I don't say that they ever mix it, but it sometimes tastes as though they did. Pure imagination on our part I suppose.

A few years ago I took the time to visit a large bush and see the apparatus used there. The sap was gathered and syphoned into a large, copper lined cistern, from which it fed into the evaporator through a float valve, so that the attendant could, if neccessary, attend to other things, or even leave everything open and go to the house and to bed and rest, assured that nothing could happen that would do any damage. There are times when the sap is running that the evaporators are run to their full capacity, night and day, for one can only make sugar when the sap runs. An old Dutchman once purchased a farm which had a good bush on it, and he made elaborate preparations for sugar making, and when his neighbors questioned him about it he he said: "Vell, if it pees a goot peesness I keeps him up all summer," but sad to relate, when the buds start the sap stops, and then they make vinegar one or two runs, and gather into the sugar house the buckets and wait for another sugaring season.

I have seen maple sugar that had been placed into a trough when hot and stirred with a hoe, that was fine and white, granulated like other sugar, but of course did not taste like anything but maple sugar. My mother used to make warm biscuits, and we would eat maple syrup with them when I was a boy, and it seemed to me that I would never have nor desire a better dish; but that was syrup made in our own bush and was all maple.

There is plenty of hard work connected with sugar making, but it is partly compensated for by the company one generally has at this season, so that nearly every day you sugar off, and have a royal good time all around, so that one scarcely notices the hard work part.

This is a great time for the children, especially the boys; they are strictly in it from the time they are up in the morning until the pan is swung off the fire, and the syrup is taken to the house, and the fires banked for the next day's work. I can remember going into the bush with the men, and riding on the sled that had a hogshead chained on, driving around among the trees, gathering sap and then going to the sugar house, or shanty, as we called it, and building fires under the huge pan, most of the time being in the way of the men, but probably working harder than any one on the job.

I wish that every reader of the DAIRYMAN could have a treat of real maple sugar. But I expect that those who can not make it in their latitudes have something else that we can't have, that will compensate them, and be to them a luxury. While this has no connection to the dairy cow or to farm management, still it may be as interesting and a change from the regular line of thought as taken up by the DAIRYMAN, giving seasoning to the paper, and making the other articles more appreciated. JAS. M. PLATO.

New York.

Oil Meal for Lice on Cows.

ED. HOARD'S DAIRYMAN:—I think I have a better remedy for lice on cows, than the one described by "Subscriber" on page 44. I have always made it a rule not to buy my cows, but to raise them, raising the heifer calves from the best cows. My Babcock tester and scales are always handy and ready for use, so that I am enabled to keep the best and dispose of the worst. Sometimes buy a bull calf when I think I can buy a better one, than I can raise from my own stock. I have been dairying for over 26 years and have never had any trouble from disease of any sort.

Some years ago I made a departure from my rule and bought a fresh cow from a neighbor and soon discovered that she was pretty well peppered with lice and having read somewhere, I think it was in the DAIRYMAN, that oil meal fed was a pretty sure remedy, I got some and gave her a generous dose in her ration; it certainly acted like magic, for in a very few days the lice had all left for parts unknown and I have never been bothered with them, either before that time or since. J. T. M.

Brandelwin Summit, Pa.

A New York Herd Report.

ED. HOARD'S DAIRYMAN: — Having read reports from various dairies, in your valuable paper, I thought I would send a report of my dairy of 23 cows. They are a mixture of Holstein and Ayrshire. Or to put it exactly, they are common stock.

I began drawing milk to a Limburger factory, March 11th and drew until Dec. 24th. The amount of milk per month and the price is as follows:

March	6,505	$1.—
April	13,873	.9632
May	17,964	.7914
June	20,219	.8050
July	19,423	.7763
August	17,686	.8722
September	15,530	1.0702
October	11,373	1.1755
November	6,927	1,3200
December	4,352	1.1500
Total	133,852	

The whole amount of money taken in was $1,250.07, making an average of $54.35 per cow.

The kind of grain used is mostly "mixed feed" and corn meal is fed until about the 20th of May and then cows depend on pasturage alone until the 1st of September, when the same ration of grain is given.

During the season I used $300 worth of the above grains. Counting pasturage at $5.00 per cow, and hay at $16.00, a profit of $20.35 is left. The hay and pasturage is furnished by my farm of 150 acres. B. W.

West Branch, N. Y.

Soap for Washing Milk Cans.

ED. HOARD'S DAIRYMAN:— In your last issue we note on page 26 "Instructions to Patrons." They are so nearly identical with a circular that we issued last year that we enclose a copy.

We have been asked several times why we object to soap for washing cans. It is not because of any harm that will result from a proper use of soap, but because more than half the people will put a bar of soap in the can while washing it and pieces of soap will be scraped off and stick in the seams and most of it will remain there to taint the milk.

HARLAN CRY. CO.

Harlan, Ia.

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condense the questions into plain specific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

Butter Fat and Butter.

To settle a controversy, will you please give the amount of butter 100 pounds of milk, testing 4.1, should make? C. C. W.

Hampstead, Md.

One hundred pounds of 4.1 per cent milk will make 4.78 pounds of butter, calculating the overrun at 1-6. The actual creamery overrun may be slightly above or below this, according to conditions.

Cows Losing Flesh.

Will you please advise me in the matter of compounding a ration for my cows? Have a mixed herd, will average about 1,000 lbs. We are now feeding malt sprouts, linseed meal (new process), cotton seed meal, distillers dried grains, 34% protein, 12% fat, wheat bran and corn and cob chops, with good corn fodder as roughage. Malt sprouts on hand cost me $16.50 per ton; linseed meal, $28; cotton seed meal, $28; distillers dried grains, $26; wheat bran, $23; corn is worth about 60 cents per bushel. The ration I am now feeding gives a good flow of milk, but my cows seem to be losing flesh. R. C.

Morristown, Pa.

It is quite the proper thing for cows giving a good flow of milk to lose more or less flesh. It is an indication that the dairy temperament is stronger than the flesh-making temperament. However, if these cows are losing flesh more rapidly than they should, the ration might be modified to some extent by increasing the proportion of carbohydrates, and the way to accomplish this would be to substitute ground corn for the corn and cob chops, omitting the cob. Cob meal of itself has very little feeding value, but experience has shown where clear ground corn is the only grain that the addition of cob meal seemed to be a benefit; but where bran and malt sprouts and dried grains are used there is no necessity for this. We see no particular necessity for including either malt sprouts or cotton seed meal in the mixture. New process linseed meal, distillers dried grains and ground corn with a little bran mixed would make quite as good a mixture, in our judgment; or omit bran and include the malt sprouts as being much cheaper.

Cost not to be Considered.

We have corn ensilage, very nice and well preserved (but no corn in it, the very wet weather shut us off so we could not tend the corn, the stalks were nice but no ears), mixed hay, clover and timothy. Please formulate me a ration with wheat bran, corn meal and old process oil meal, labeled about 32 per cent protein, to obtain most milk, not taking cost into consideration.

Auburn Center, Pa. C. W. P.

A mixture of 6 parts bran with 3 parts ground corn and 2 parts old process oil meal, all by weight, in connection with the silage and mixed hay will make a very acceptable ration. The amount of the grain mixture to be fed will depend almost entirely upon the capacity of the cows to respond, and this can only be determined by close observation in connection with the weighing and testing of the milk. Undoubtedly some of the cows in this herd could profitably use 12 or 14 pounds of this grain mixture, and others not more than half as much. Commence by feeding moderate amounts and increase gradually with each cow as long as she shows ability to use the feed for milk making purposes, but if there is a considerable increase in body fat or weight, the limit of profitable feeding has been passed.

Silo for Twenty Cows.

I wish to build a silo large enough to hold feed for 20 cows. Would like some advice on building and prices at which same ought to be built; also something in regard to the manner in which it should be filled, and material which is best to fill with. M. B.

Liberty, Ind.

A silo for 20 cows should hold at least 80 tons, and, if a round silo is built, probably its best dimensions would be 16 feet in diameter and 24 feet in depth. We can hardly afford to repeat, in response to every inquiry, specific directions for building silos, but would refer this inquirer to the communication on page 99.

Corn is the standard crop for silage but other crops may be used. In locations where the cow pea can be grown to advantage we think it desirable to mix cow peas with the corn. Cow peas and sorghum also make a good mixture for silage. It is practicable to put whole corn into a silo, but it is much better in our opinion to run the corn and other material through a cutter, cutting it into pieces about ¾ of an inch long and elevating it either by carrier or blower over the top of the silo, keeping it evenly distributed and well tramped around the edges.

Butter fat and Cream.

What per cent of butter fat is required in cream to make it good to whip? Will 25 per cent cream whip? If milk tests 3.6 per cent, will 10 gallons of this milk make 1 gallon of cream 36 per cent, By separator, and 9 gallons—1 gallon of cream, 34.2 per cent. D. R.

Milton, Ont.

From 22 to 25% of fat makes a good whipping cream, but age and temperature have a great influence in making the cream a good whipper. The cream should be 12 hours old at least, and be cold when whipped; 50° F., or below is necessary in some cases.

Ten gallons of 3.6 per cent milk will make very close to 1 gallon of 36 per cent cream and 9 gallons of the above milk will make 1 gallon of 32 per cent cream.

A New York Ration.

Will you kindly form me a ration for cows weighing from 700 to 800 lbs. Having corn silage with but little corn in it and clover hay; corn meal $23; bran, $24; middlings, $28; gluten feed, $30; oil meal, $32 to $35; cotton seed meal; $35.

Dryden, N. Y. F. P. H.

As a basic ration we would suggest 30 lbs. of silage, 10 lbs. of clover hay, 4 lbs. of bran, 2 lbs. ground corn. For the heavier milkers add 1 lb. or 2 lbs. of gluten feed. Let the cows have salt twice a day, a large teaspoonful each time.

Rape not Recommended for Milch Cows.

I would like to beg your indulgence and ask an oft repeated question to be answered as you see fit. It is this: Can I sow oats and rape together? and use it safely for pasture for dairy cows, if I turn them on in the morning, and take them out before noon so they get no more of it that day.

I have been for some time a reader of your paper and find very much that is of interest as well as benefit to an up-to-date dairyman. W. C. A.

Johnstown, Wis.

Rape is seldom or never recommended as a forage for milch cows as it has a strong tendency to produce tainted milk. Prof. Shaw tried rape at the Ontario Agricultural College without experiencing any objectional results and it may be that with wider experience rape may be accepted as a standard food for milch cows, but hardly as a pasture plant. The tramping of the cows through the fields would destroy more than they could consume. Probably the better way would be to let the rape have considerable growth and then cut it for a soiling crop. We do not apprehend that there would be any danger to the cows in using the rape and oats as suggested, the more serious question being whether it would be profitable.

Cream Not Whipping.

Can you tell me of some process by which cream may be rendered thicker and so easier to "whip."
Tallahassee, Fla. J. P. A.

As the above inquiry comes from Florida, it is probable that much of the trouble in the cream not whipping comes from its being held at too high temperature. Cream for whipping should contain 22–25 per cent of fat, and should be as cold as it can be made, below 50° F. always. It must also be over 12 hours old before it will whip well. Sometimes where cream, even under the above conditions, still refuses to whip, a small quantity of viscogen is used; this is a combination of lime and sugar that when used in small amounts makes the cream thicker and easier to whip. The viscogen can be obtained from dairy supply houses.

A New York Ration.

I would like a balanced ration to correspond with clover and timothy hay, to feed fresh cows, to keep in good flesh and give a good flow of milk. Cows high grade Holsteins. Corn meal, $22 per ton; distillers grain, $26 per ton; Buffalo gluten $26 per ton: middlings, $24 per ton; bran, $22 per ton; oats, 40 cents per bu. J. G. H.
East Ashford, N. Y.

From the feeds named and the prices given, we should be disposed to try as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates	Ether Extract
20 lbs. hay	17 06	.96	7.92	.32
5 lbs. grains	4.60	1.23	1.94	.57
3 lbs. corn	2.67	.23	2.00	.13
Totals	24.33	2.42	11.86	1.02

If the hay is high in price and limited in amount, less hay and more grain is fed.

Peas and Oats for Silage.

I put about ten acres into soiling crops and it occurs to me that I might plant it all to oats and peas at one planting and put it in one of my silos for summer feeding, thus doing away with the many plantings and daily cutings and hauling, usual in a system of summer soiling.

I could then plant the same land to barley and peas later, say in July, after the oats and peas are cut and insure the two crops on all the land. Please tell me what you think of this before plowing time?

How much green feed, in tons, could I get from well fertilized land in these two crops, and about what would the same stuff weigh, if cured into hay? Will green winter rye make good ensilage for a few weeks? J. L. M.
Hazelbrook Farm, Wayland, Mass.

We think the plan of cutting the peas and oats into the silo will work successfully, especially if the oats are not allowed to become too ripe. Experience thus far has not favored the attempt to silo hollow stemmed forage. Hence we could not advise attempting to make silage of green rye, but there seems to have been little or no difficulty with the mixture of oats and peas, J. L. M. is much better qualified to estimate the probable amount of feed to be obtained from this land than we can possibly be.

Adding Stable to Barn.

I am going to ask through the columns of your paper about building a cow stable. I have an old barn which will do for keeping hay in, enough for 20 cows or more. Now this old barn is about 70 ft. long and my intention is to build one slanting roof stable on one side of the old one and joining the same. How wide would you build it for one row of cows, and how would you build it to make it convenient for feeding from the heads. Can get an 18 foot slanting roof, and how many windows, as this would be on the north side of the old one?
Iola, Wis. A, J. B.

It is unfortunate, we think, that this stable addition to the barn must be built on the north side. Sunlight is a very much needed adjunct to every stable. However, one must sometimes do as best he can, if he cannot do as well as he would. Where one cannot get direct sunlight, he should get as much indirect sunlight as possible, and to this end we would put in not less than ten windows, 7 feet apart from center to center and 3½ feet from either end. If the feeding alley is to be provided for in the addition, we think it should not be less than 16 feet wide at least. This will give a feeding alley 4 feet in the clear, 2 feet for mangers, 4½ feet for standing platform, 18 in. for gutters, and 4 feet for walk behind the cows. It would be an easy matter to provide one or more hay chutes from the main barn into the feeding alley. We would make arragements for at least three ventilating flues, leading up the back side of the stable and under the rafters into the main barn and out through a cupola.

Sand in a Well.

A subscriber at Jackson, Tenn, writes that he has a bored well with a pump worked by hand or power. He had about 18 feet of water in this well, but did not think that quite sufficient, so sunk the same point about 6 ft. furtherdown into a sand bed and is now troubled with very fine sand, "as fine as flour", he writes, which fills up the openings in the point and chokes the valve in his pump. He inquires whether it would be possible to dig a well 3½ feet in diameter, sinking it about 12 feet below the water line, but not into this bed of quicksand, as we understand it, and by laying up a brick wall in cement, fence out the sand so it will not bother him.

If the water bearing strata is not so loose as to be continually caving in, he could probably dig and brick up the well in the manner suggested, but possibly might be obliged to resort to curbing, and then find more or less difficulty in sinking the well. This matter of sinking wells is coming to require the service of experts, and, if possible to obtain one, we think Mr. B. would be justified in going to quite a little bit of expense to have such a person come and look the situation over and give advice in the premises. Possibly the better way would be to endeavor to sink a pipe through the present layer of quicksand.

Bean Meal for Cows.

Would like to inquire about the nutritive value of stained beans; could sell them for about $14 per ton. We have wheat bran, Globe gluten feed 28 per cent protein. Whether it would be an advantage to grind and mix with bran and gluten to feed Jersey cows, and what effect would they have on the butter? Also feed cows corn silage with some clover hay. We have been feeding cotton seed meal; are about out now. How would ground beans compare with cotton seed meal? W. & I.
Tompkins Co., N. Y.

Bean meal while rich in protein falls considerably below cotton seed meal in this respect. It is not yet a recognized feed for milch cows, probably because other feeds answering the same purpose are usually much cheaper. We have also heard it reported that cows do not as a rule relish this bean meal. What its effect may be on the quality of the butter is also problematical. We would advise our friends to make a trial in a moderate way and ascertain for themselves as to both these points, and report to the DAIRYMAN for the benefit of other readers. If the meal proves palatable to the cows, and does not affect the quality of the butter, the following formula suggests a ration that ought to prove eminently satisfactory as an average for a herd of cows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates	Ether Extract
30 lbs. silage	7.92	.39	4.20	.21
10 lbs. hay	8.47	.68	3.58	.17
3 lbs. beans	2.57	.69	1.51	.04
5 lbs. bran	4.40	.63	1.93	.15
Totals	23.36	2.39	11.22	.57

Velvet Beans in Wisconsin.

I spent several weeks in Florida, last winter, and brought home a few velvet beans merely for

"ADVERTISEMENT."

ASK FOR HELP.

A Postal Will Bring You a Way to Get Well.

Think how often you have read this offer. Why do you wait, while thousands write me and get well?

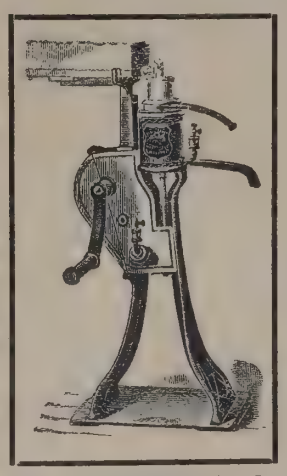
If you sick ones could only know what I know, you all would write.

I will mail you an order—good at any drug store—for six bottles Dr. Shoop's Restorative. You may take it a month on trial. If it succeeds, the cost is $5.50. If it fails, I will pay the druggist myself—and your mere word shall decide it.

Whatever your prejudice or doubt, you must know this:—If the remedy did not succeed, the offer would ruin me. It must be apparent that I have learned how to cure.

When I have the faith to take all the risk, won't you merely write a postal to get well?

I have spent a lifetime in learning how to strengthen weak inside nerves. My Restorative brings back that power which alone operates the vital organs. I treat a weak organ as I would a weak engine, by giving it the power to act. My way always succeeds, save when a cause like cancer makes a cure impossible. And most of these chronic diseases cannot be cured without it.



You'll know this when you read my book.

Simply state which book you want, and address Dr. Shoop, Box 934, Racine, Wis.

Book No. 1 on Dyspepsia.
Book No. 2 on the Heart.
Book No. 3 on the Kidneys.
Book No. 4 for Women.
Book No. 5 for Men (sealed)
Book No. 6 on Rheumatism.

Mild cases, not chronic, are often cured by one or two bottles. At all druggists.

24 Car-Loads
U. S. SEPARATORS TO ONE CUSTOMER.

Our competitor, the maker of the gun-barrel bowl separator, is so elated over accumulating 24 cars of his separators so as to ship in one train to be distributed all over the West and Northwest that he bursts out with the statement that this is

"More separators in a single shipment than any of our competitors are able to manufacture in a year's time. . . . . .

Bless the dear man's heart, we have sold in the last two months **Twenty-four Carloads of U. S. Separators to one customer alone,** and this is only one customer out of several hundred that we are daily shipping U. S. Separators to.

Does the reader see any difference between

34 Carloads U. S. Separators to one Customer and 34 Carloads of Competitor's Separators for all the West and Northwest.

Our sales are so large that, notwithstanding we have on our payroll nearly 800 persons, we cannot accumulate stock. The Dairymen all over the country are crying for U. S. Separators, and we are going to supply them.

THE U. S. SEPARATOR HOLDS THE WORLD'S RECORD

for close skimming, and is acknowledged to be the most thoroughly and substantially made, and will wear the longest.

its flowering vines. Afterward I saw an article in your paper from Mr. Kline Varn, of Ft. Meade, Florida, telling of value of beans on a farm. I sent to him and got some beans and also had a brother send up a peck, all of which I planted in different places, and under many conditions, but I did not get a flower or really a good plant. True the spring was backward, and many of the first I planted did not start at all, and then frost came very early so the benefits were nothing as I could see. C. L. A.

Eau Claire, Wis.

The velvet bean is not a northern plant, and it is very doubtful if it is worth the time and trouble to make any attempt to raise it in Wisconsin. Soy bean or alfalfa will give much better returns than the velvet bean.

The Best Strain of Holstein-Friesians.

A correspondent asks us to tell him where he can obtain the best strain of Holstein-Friesians, and submitting a list of feeds requests a ration formula.

If we had the records of all the Holstein-Friesian cows in America, and the time to study and tabulate them exhaustively, we might be able to answer our correspondent's inquiry with some degree of satisfaction to ourselves and with a certainty of provoking dissatisfaction with every owner of Holsteins not belonging to the particular "strain" named. But we do not have such records and they cannot be obtained. Moreover every year, and almost every day brings forward new candidates for favor. The better way for this inquirer to pursue is to insert a short advertisement stating what he wants and inviting correspondence from breeders who think they can meet his requirements.

If the roughage mentioned is literally "corn fodder" and not simply corn stover (corn stalks) we advise him to feed, say, 25 lbs. mangels, 4 lbs. bran, 2 lbs. cotton seed meal and all the fodder the cows will eat. Give half the mangels, bran and meal, with a teaspoonful of salt at night, and the other half, with salt, in the morning.

Temperature at Which Milk Sours.

What temperature will milk sour quickest at, and what temperature will bottled milk keep and separate most favorably at? H. C.

Chicago, Ill.

Milk will sour quickest at a temperature between 90° and 100°F., and the rate of souring decreases slowly as the temperature is lowered until at 40°F., there is little growth of bacteria and the formation of acid is very slow.

Bottled milk should be kept as far below 50°F. as conditions will warrant, if it it is expected to keep for any length of time.

Another Barn Plan Wanted.

Mr. H. B. S., of Chateaugay, N. Y., writes as follows:

We are about to build a dairy barn large enough to stable about 60 head of cattle and 8 horses, size of barn to be 40 ft. x 160 ft.; no basement. We have an idea of the Shawver plank frame in mind and would be pleased for your opinion about building, The question of stable floors, cow ties, etc., presents itself and any information about the same will be appreciated.

Our first suggestion to this correspondent is that a barn 160 ft. long involves a good many more extra steps than it would to build a barn with double wings as suggested on page 938 of the preceding volume. Neither do we think it necessary that a stable should be 40 feet in width. Thirty-two feet in the clear is, in our judgment, quite sufficient.

The Shawver plank frame system of building is all right, but we have abundant reason to believe that even this is more expensive than necessary. We see no reason why a barn may not be built on the same principle that large store houses are built, and we suggest to this inquirer, as we have to several others, that it would be money well invested to purchase a copy of King's Physics of Agriculture, where this question of barn building, stalls, and other important farm questions are so thoroughly and scientifically discussed.

Alfalfa Questions.

Where can I get flaxseed meal in 100 lb. lots?

Will alfalfa do well on open, coarse, sandy soil on river bottom land where water stands 10 to 25 ft. from the surface, and in times of high water, less? W. P. H.

Muscatine, Iowa.

Linseed meal in small amounts can probably be best obtained from your local market.

Alfalfa should do well on such soil, provided that the upper layer contains sufficient food material and the ground water does not come nearer to the surface except for short periods. If the water comes to within 5 feet of the surface and stays there for long periods, it would not be well to risk alfalfa in such a location.

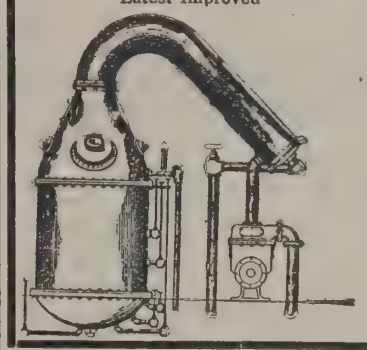
WAS REFUSED LIFE INSURANCE.

Rejected on Account of "Coffee Heart."

Life insurance companies have fully established the fact that the use of coffee causes an organic derangement of the heart, shortening the long beat and imperiling life. For this reason habitual coffee drinkers are refused life insurance in many cases. A well-known merchant of White's Creek, Tenn., proprietor of a large store there, says:—"Three years ago I was examined for life insurance and to my surprise was rejected because my heart action was at times out of place 15 beats in 60.

"I consulted several good doctors and was invariably asked by them, "Do you drink ardent spirits? use tobacco? or drink coffee?' to the first I answered 'Very little,' to the second, 'No,' to the last, 'Yes,' and they would all say 'Quit coffee.'



"I determined to do this. I had read about Postum Cereal Coffee and bought and used it and I liked it as well as the best of real coffee and as a result of its use in place of coffee I find myself without a skip in my heart action and I can get insurance on my life cheaper by 25 per cent (notwithstanding the advance in age), than I could when I first commenced using Postum." Name furnished by Postum Co., Battle Creek, Mich.

Our Special Elgin Letter.

ED. HOARD'S DAIRYMAN:—On the Elgin Board of Trade today, butter advanced one cent. Seventy-five tubs were offered for sale, but were not sold, although 29 cents were bid. The price was made firm at 28½c by the Quotation Committee. The sales for the week were 508,500 pounds. Former markets were as follows:

	Sales.	*Price.*
March 9, '03	0	27½c.
March 17, '02	0	27c.
March 18, '01	0	21½c.
March 19, '00	0	34c.

Elgin, Ill., Mch. 16, '03. H. C. B.

The McGeoch Sale.

ED. HOARD'S DAIRYMAN:—Never since first importations were made, have Holstein-Friesian cattle been in so great demand, nor stood so high in popular favor, as at the present time. Much of this is due to the wise system adopted by the Holstein-Friesian Association of having the cows of this breed officially tested by representatives of the different state Experiment Stations and the records, so made, stand today as unchallenged monuments to the great superiority of the Holstein-Friesian cow as a butter producer.

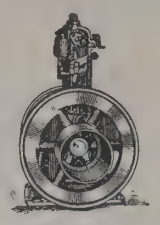
The public sale scheduled to take place May 6th in Milwaukee, Wis., of a draft of some seventy head of these cattle, from the herd of Mr. A. N. McGeoch, is peculiarly attractive at this time, as some forty cows and heifers will be sold that have been officially tested.

Among these will be found the great heifer, Duchess Ormsby 2d's Hengerveld DeKol, who at age of 2 years, 1 month and 29 days, has record of 19.02 lbs. of butter in seven days. This record stands at the head, being the largest amount of butter ever produced by a heifer with first calf. A half-sister, Dame Marjory DeKol, also ranks well up near the head, having record at 2 years, 4 months and 24 days of 16.19 lbs. butter in seven, and 65.08 lbs. in thirty days.

Liscomb Aaggie 3d, the best of the three-year-olds, has record of 21.58 lbs. butter in seven and 86.69 lbs. in thirty days. Piebe Queen 2d's Princess at age of 4 years, 9 months, has record of 22.18 lbs. butter in seven days.

Wit Duchess at 5 years, 5 months, 5 days of age, has record of 24.88 lbs. butter in seven days..

In addition to the list of cows that will be offered, we will place on sale a most attractive lot of young heifers and bulls of the richest breeding and all from officially tested cows. The two great service bulls, DeKol 2d's Paul DeKol No. 2 and Gem Pietertje Hengerveld Paul DeKol, will be included in the sale list. The first named has eight daughters in the list and is also a full brother to the wonderful young cow, May Hartog Pauline DeKol, who at four and a half years of age, has just demonstrated the wonderful capacity of the Holstein-Friesian cow by making an official record of 29.26 lbs. of butter in seven and 112.08 lbs. in thirty days. He is also a half-brother to the great cow, Lillith Pauline DeKol, who has official record of 28.23 lbs. butter in seven and 127.49 lbs. in thirty-five days.



Gem Pietertje Hengerveld Paul DeKol is the sire of the world's record heifer, Duchess Ormsby 2d Hengerveld DeKol, Dame Majority DeKol and others high up in the list.

Such breeding as these two great bulls have, coupled with their individual merit and great prepotency, places them well to the head as the greatest of living sires.

As is probably well known to your readers, the cows of the McGeoch herd run very high in per cent of fat in their milk. Believing that fat can be bred, but not fed, into milk, the families selected have been those in which the cows have shown an ability to give milk testing high in fat, and we point with pride to the fact that a greater number of cows in this herd have averaged over four per cent fat during official test than in any other.

While it is with the utmost regret that we find it necessary to reduce the number of cattle to the capacity of their new quarters, yet we believe that in placing the best cattle in the herd in the sale, that the same will be appreciated by all who are interested in the welfare of the breed and that the opportunity to add to present herds, or to establish new ones, will be taken advantage of at this sale.

Milwaukee, Wis. H. B. DAGGETT.

GASOLINE ENGINES

as power for the dairy have passed the experimental stage. Many dairymen now have them and all eventually must have them. The only questions to decide are the amount of power needed, and the most desirable make. With twenty-seven years of experience behind us, and a plant that has grown from 50 engines a year to 1500 a year capacity, we feel that we are equipped to build the best. There are other reasons why the "OTTO" is superior. We will tell them in this space from time to time. If in the meantime you need power, write us, mentioning this paper

All Well-Appointed Dairies and Ceamerries

Where large or small quantities of bottles are used, need drainer racks. Draining of bottles after washing is a serious question to many. My Drainer Racks hold eight and ten bottles, which is the width of the average bottling machines in use.
They are made of second-growth pine, well made. The spindles or dowels are put right in the middle in such a way that they do not drive through when the rack receives a blow on the side, the holes for the spindle being bored but half way through the side of the rack. By having the spindles in the center of the rack it makes no difference which side of the rack is up. I also furnish them with spindles so arranged that they can be piled on top of each other. I have sold many thousands in the last year, and consider it one of the greatest labor savers in a dairy or creamery. My illustrated catalogue tells you all about this as well as any other article you need. A postal card will bring it to you.
J. S. BIESECKER, 59 Murray St. NEW YORK CITY.

Eggs—Frm, good demand; fresh near by and western, 16½c at the mark; southwestern, 16½ at the mark; southern, 16c at the mark.

Cheese—Quiet but firm; New York full creams, prime small, 14@14¼c; fair to good, 13¾@13¾c; prime large, 14c; fair to good, 13½@13¾c.

BALTIMORE, March 16—Butter—Firm, unchanged; fancy imitation, 21@23c; creamery, 28@29c; ladle, 18@19c; roll, 17@18c; good roll, 16@17c: store packed, 15@17c.

Eggs—steady, lower; fresh, 16c.

Cheese—Firm, unchanged; large, 14¼@14½c; medium, 14⅜@14¾c: small, 14½@14¾c.

KANSAS CITY, March 16.—Butter—Creamery, 22@23c; dairy, 19c.

Eggs—lower; fresh Missouri and Kansas stock, 11¾c, cases returned; new whitewood cases included, 12½c.

ST. LOUIS, March 16—Butter—Quiet; creamery, 20@28½c; dairy, 18@21½c.

Eggs—Lower at 12c for fresh.

NEW ORLEANS, La., Mar. 16—Butter—Separators scarce aad active at 29c; renovated, 19c; ladles 14@16c

WASHINGTON, D. C., Mar. 16—Butter—Market firm at 29c.

NEWARK, N. J. Mar. 16—Butter—Market steady at 29c.

Eggs—Quiet at 18c.

TOPEKA, Kan., Mar. 14—Butter—Creamery butter, 27½@28½c; dairy, 16½@19c.

Cheese—Sales 453 boxes; Longhorns, 13¼c; Twins, 13c; Daisies, 14c.

NEW YOKE MARKET.

NEW YORK, Mar. 7—Butter—Receipts for the week, 33,054 packages. Exports for the week, 3,623 packages.

Extra fresh creamery butter has been short all the week and under good demand. Prices advanced about 2c per round since our last and close steady with stocks well cleaned up. Firsts and seconds had free inquiry and prices were close up to the price of Extras. Fancy quality of New York State Dairy, made from new milk, sold at 25 to 27c, but there is so little of it arriving that we note sales of several lines of strictly fine goods it is hardly quotable There was more doing in June make, and at 23@24c, and several hundred tubs of really goodstock at 21@22c. and one good parcel of sound butter at 20c.

Shippers bought freely of good to fine fresh ladles at 15@16c, and renovated butter, at about same price. Market closes steady. We quote:—

Creamery, fresh, extra, 29c; medium, 26@28½c; poor, 20@25c; creamery, June, extra, 23@24c; medium, 21@22 c; poor, 16@20c. Ladle, extra, 19@20c; medium. 15@17c; poor, 12@14c.

Cheese—Receipts for the week—10,612 boxes. Exports for the week—4,115 boxes.

Quotations were marked up on fancy September cheese, a quality that can hardly be found in this market, but for all other grades there has been no improvement; we note sales of good to fine quality of small colored cheese at 13¼@14¼c, with an occasional sale at 14⅛, and there were sales for Eastern accounts of small white cheese at 13½@14c.

Shippers keep nibbling away at under grades full cream and Winter make skims at prices ranging from 8@12c. We quote:—

Full cream, small extra, 14½@14¾; medium, 13½@13¾; poor. 10@12½c. Full Cream, large, 14@14½ medium, 13@13¾; poor, 10@12c.

Eggs—Receipts for the week, 33,902 cases.

Recipts were moderate and trade good; prices are 19@19½ cents and strong at the close. We quote:—

New York & Pennsylvania, finest, per doz. 19½@20c; Northern & Western, finest per doz. 19@19¼c; all sections, fair to good, per doz., 15@18c. Refrigerators, fair to good., 12@16c:

177 Chambers St. DAVID W. LEWIS & Co.

BALTIMORE MARKET.

BALTIMORE, Md., March 12—Butter—Soon after our last issue, there was an unsettled feeling prevading the market, which tended to check buying to some extent; but at the opening of the market this week, there was a better feeling prevailing and buyers were not slow in taking hold of any and all attractive offerings. Extras continue in very moderate supply; hence there has been a much better inquiry for firsts and good seconds. In fact, there has been a very close clearance of all fresh stock suitable for table purposes. There is very little trading in storage creamery, unless the quality is strictly fine. Fancy imitation creamery meet a prompt sale, and in several instances our top prices have been exceeded. Ladles are in fair supply; all fresh, sweet arrivals find ready sale, but defective lots are hard to sell, even at reduced prices. Rolls and packing stock—The receipts are fully equal to the requirments. Prints and blocks meet quick sale, when of satisfactory quality. The market closes fairly active and firm at the advance over our last quotations on all attractive stock.

Creamery Separator, extras, 29@29½c; firsts, 27@28c; seconds, 24@26c. June Creamery, extras, 24c; firsts, 21@22c; seconds, 20c; Imitation Creamery, extras, 21@22c; firsts, 19@20c; seconds, 16@18c, Iowa & N. W. Ladle, extras, —firsts, 18c; seconds, 15@17c. Ohio & Indiana Ladle, extras, — firsts, 17@18c; seconds, 15@16c. Roll, Ohio, extras, — firsts, 15c; seconds, 13c. Roll, W. Va., extras, — firsts, 14@15c; seconds, 13c. Ohio Store packed, extras, —; firsts, 14c; seconds, 13c. West Va. Stored packed, extras, —; firsts, 14c; seconds, 12@13c. Creamery blocks (2-lb.) extras, 30c; firsts, 28@29c; seconds, 25@27c; Creamery prints (½-lb), extras, 30@31c; firsts, 29c; seconds, 25@28c: Md. Va. & Penna. Prints, extras, 29@30c; firsts, 26@28c; seconds, 22@25c.

Eggs—Soon after our last issue, there was quite a falling off in the receipts, and with an active demand the market has from day to day been kept well cleaned of all desirable offerings, and prices have been advanced right along; today under continued moderate supplies and a brisk consumptive demand, the market closes firm at 17½ cents. Duck eggs have been in fair receipt, but the supply has not been equal to the demand; hence, the market has been kept well cleaned of all desirable offerings at steady values. NOTE—Ship all of your eggs in cases, and not in barrels or boxes.

READING NOTICES.

All Reading Notices under this head are at the rate of 25 cents per line.

For Sale—Pure bred Guernsey bulls and grade heifers. Also Early Black Soy Beans at $2.00 per bushel. A. H. HINMAN, Neenah, Wis. 6-4

Angelus Herd of Guernseys—For sale three-year-old bull, Befilius 6398. brought by me from Wisconsin. Also bull calf out of Waller by Wolfrum he out of Materna sweepstakes cow at World's Fair. W. M. MARCH, 1798 W. 39th St., Los Angelos, Cal. 6-2

Wanted—Single man on large dairy. Only good milkers need apply. F. W. ADAMSON, Lake Bluff, Ill. 4-tf.

For Sale—Large and well equipped creamery and ice cream plant in leading southern city of 125,000 population. Paying $3,000 profit annually and can be increased. Steam boiler, engine, churn, butter worker, separator, Babcock test, bottle washer and ice cream plant (wholesale ice cream trade year round). Wagons, horses, office fixtures, etc. Office, creamery, and stables all under one roof. Requires ($7,000) seven thousand dollars. Satisfactory reasons for selling. Write for particulars to "ICE CREAM," care Hoard's Dairyman. 3-tf

For Sale—Creamery, located 100 miles northwest of Chicago, with large local retail and wholesale trade. Has run ten years without a stop. Ill health cause for selling. Address "W", Hoard's Dairyman. 5-2

Butter Wanted—We want to contract for the output of a good sized creamery in Minnesota or Wisconsin. Factory must be equipped for making extras the year round. Will pay good price and cash for each shipment. Address FERRY BUTTER CO., 238 Quimby St., Cleveland, Ohio. 5-2

Wanted—A foreman or manager of an up-to-date dairy. Married man preferred. Good wages to right man. Also want two good milkers not afraid of work. High class dairy and first-class wages to right kind of men. Address MARCH, care Hoard's Dairyman. 5-2

Situation Wanted—To operate a cheese factory. Have had one year's experience under a number one cheese maker, and I am a graduate of the Wisconsin Dairy School at Madison. I am a single man. Address ARTHUR BOIS, Marengo, Ill. 5-2

For Sale—A butter dairy complete, with 42 cows. Located near the best market in the west A good chance for a small capital. For full particulars address 412, care of Hoard's Dairyman. 5-4

Young Guernsey coming 1 year old for sale. MRS. A. W. LEHMAN, Neosha, Wis. 5-2

Jersey Bulls—3 fine calves. grandsons of Diploma. Write ROLLA OLIVER, Dearborn, Mo. 6-2

Wanted—Three married men, with or without families, to work on large dairy. Must be good milkers. Salary $25 00 per month, house rent and fuel furnished. Give experience and all particulars. RICHLAND FARMS, Greensboro, Ga. 6-4

Holstein-Friesian Bull Calves For Sale—Sired by Duke DeKol, grandson of DeKol's Butter Boy. Dams are heavy milkers. Address E. W. MOORE, Spring Creek, Warren Co., Pa.

Experienced butter and cheese maker, graduate of Wis. Dairy School, wishes to change position. Have handled gasolene engines and ammonia machines. Good references. Prefer to go south, or to the Pacific coast. Address M. 66, care Hoard's Dairyman.

Wanted—May 15th man and wife for fancy dairy farm. Both must be neat and capable. Exceptionally fine place for right party. References required. LOCK BOX 360, Hinsdale, Ill.

$65.00 buys a Holstein bull ready for service. Dam's official test is 16 lbs. 12 oz. McKAY BROS., Buckingham, Ia. 6-2

Do You Want—A Hay Fork Returner? Every farmer having a barn should have one. A hummer for agents. Circulars free. ROONEY RETURNER CO., Box D., Independence Iowa. 50-tf

For Sale—The entire outfit for making American cheese; all in good order. Will be sold at a bargain. JAMES VIPOND, Shullsburg, Wis. 4-6

Position Wanted—In creamery as buttermaker. Have had long experience in creamery business. Can furnish first-class references. Am single, sober and reliable. State wages. Apply FRITZ S. OHLSSON, 5801 Lexington Ave., Chicago, Ill. 5-3

For Sale—Desirable dairy business with full equipment, consisting of horses, cows, farm tools, wagons, routes, etc. Leading dairy business in town of 12,000. Milk bottled. A bargain if sold at once. None but up-to-date dairymen need apply. Reason for selling—poor health. Address BOX 416, Elyra. Ohio. 3-tf

Pure Maple Sugar and Syrup For Sale—Made on our own farm. Reference: Citizens Bank of Arcade, N. Y. Address W. H. RICE, Chaffee, N. Y. 5-2

For Sale or Exchange—Registered Guernsey bull Dewey of Brookside 5512, A. G. C. C., to avoid inbreeding. Sire, Rupprecht 4461. Dam, Queen of Brookside 10205, Age of bull 5 years March 18. For further particulars address R. C. OESTREICH. Kewaunee, Wis. 6-3

For Rent—Creamery with full outfit of machinery for making butter, in perfect working order. Location in best farming section of western New York. For further particulars address O. C. CURTIS, Hilton, N. Y. 6-2

For Sale—Southern dairy farm of 350 acres in edge of city of 20,000 population. On electric line. Railroad through land. 225 head of dairy cattle. Horses, mules, oxen, wagons and complete outfit included. Address Room 2, Court House, Anderson, Ind.

Wanted—Whole sweet milk shipped to Pittsburg daily at market price. Write to 5145 Penna. Ave., explaining distance and train time to city.

Wanted—One married man to do general farm work, wife to cook for 6 or 8 men. Also wanted—3 or four good milkers who can milk 25 cows daily. None but sober men need apply. Farm located in state of Iowa. Address No. 6 N. Ray St., New Castle, Pa. After 22nd address OAKDALE CREAMERY CO., Fort Dodge, Ia.

Large Dairy for Sale—Having decided to quit the dairy business I will sell at public sale at my farm on the Circleville Pike 1 mile east of Washington Court House, O., on Thursday, April 2nd, ninety-seven head of good dairy cows, Shorthorn, Holstein and Jersey stock. 1 thoroughbred Holstein bull, Prince Butter Boy, No. 25458, registered in 17th Volume of H. F. H. B., and from a great milk and butter family. Four dairy wagons, milk bottles and dairy outfit, thirty head of good feeding cattle, fifty head of hogs, fifteen head of horses and mules. Hogs, horses and cattle to be sold in forenoon. Sale of dairy cows to commence at 12 o'clock. Washington Court House is 40 miles south west of Columbus, O., on the Baltimore & Ohio Railroad. MRS. N. A. TAYLOR. 6-2

Good cheese maker wanted. Address HUBERT BERGS, Poniatowski, Wis.

For Sale—1 DeLaval cream separator, Alpha No 1. WEXFORD EXCHANGE, LTD., Wexford, Pa. 6-tf

Buff Jersey's latest book on Farm Stock and Dairy Work is full of practical things for practical people. The Silo, how to build and fill; ensilage, its value; soil, crops, variety and how to grow. Swine, poultry and many other subjects ably treated. Send 25c for copy. Monmouth, Ill. 47-tf

Wanted—Experienced farm hand, able to milk well. Give age and wages wanted. ST. IVES PARK FARM, Mont Clare Station, Chicago, Ill. 41-tf

For Sale—The Prairie Farm, 840 acres. May be divided into five farms with buildings. In high state of cultivation, 16 miles from Toledo. One hundred cows, selected for 40 years. Terms to suit. 5%. Address E. L. LOCKWOOD, Petersburg, Mich. 46-tf

Position Wanted—As butter maker or manager of creamery. Understand all details of creamery business and work. Fifteen years' experience. Make cheese also. Best of references. Address B. care Hoard's Dairyman. 47-tf

Guernsey Cattle—Clover Knoll herd. Send for circular. M. SAGER, Orangeville, Pa. 50-12

Guernsey Grade Heifer—For Sale 10 Guernsey grade young heifers. Seven of the lot 1 year old; 3 six months old, all in fine condition. Just right to serve as the foundation of a fine dairy. A finely bred young bull, 10 months old, registered Guernsey, to head the bunch. These heifers were bred from some of my finest grade Guernsey and Jersey cows. The lot will be sold at reasonable price. W. D. HOARD, Fort Atkinson, Wis. 52-tf

Cheese Outfit for Sale—1 Helmer's Automatic Steel Gang Cheese Press for 14½ inch hoops (new), 1 Helmer Plain Steel Press 14½ inch hoops (new), 12 galvanized 14½ inch cheese hoops (seamless). 14 tinned 14½ inch cheese hoops (seamless), 1 Schaubb power curd mill, 1 Pohl curd mill, 2 set curd knives, in fact two complete cheese outfits for sale at a bargain. RIPON CHEESE FACTORY-CREAMERY, Ripon, Wis. 4-4

A Few First-Class managers and buttermakers. No farm hands. Best of references. No charges to employers. Save time by writing THE SCIENCE AGENCY, Durham, N. H. 4-5

Wanted—An experienced butter maker for private creamery making 250 lbs. a week. Must be a good milker and thoroughly understand fine Jersey stock. State age, wages expected, reference. Address F. W. HART, City Hall, Denver, Colo.

Wanted—To trade city property for retail milk dairy. C. MENDENHALL, 1020 20th St., Anderson, Ind.

Posision Wanted—As cheese maker by a man that understands the work. Has Wisconsin Dairy certificate. Good reference. State wages in first letter. Address G. CARMAN, Minneapolis, Minn. 103 Washington Ave., So.

Swiss Cattle For Sale—As I intend to quit farming after this year, and am not situated so I can milk many cows this season, I will sell several cows and heifers and a few young bulls at very low prices for the quality of the stock. Come and see the stock and get prices. T. H. INMAN Hanover, Wis. 6-4

Creamery For Sale—A complete creamery plant in good condition for sale at a bargain. Only been run a short time. For particulars address SEC'Y. WESTERVILLE CREAMERY CO., Westerville, S. D.

BUYING A CREAM SEPARATOR.

To make no mistake in this is of the utmost importance. You don't buy one very often and it is not only a question of first cost but of daily profit or loss, daily operation, and daily wear and tear.

The right choice is really simple. In reality the De Laval machines are in a class by themselves—head and shoulders above all imitating machines.

Protecting patents make and keep them so—together with far greater experience and superior facilities in every way for cream separator manufacture.

Every big and experienced user of separators knows this and uses De Laval machines exclusively—both in factory and farm sizes.

But you may be without separator knowledge or experience. Therefore take steps to see and try a De Laval machine for yourself. It will cost you nothing to do so. That is part of the local agent's business. If you don't know him write for his name and address.

Try imitating machines too if you will and can get them, but don't put your name to an order of any kind until you know the facts about the De Laval machines and have tried one. That means your buying one.

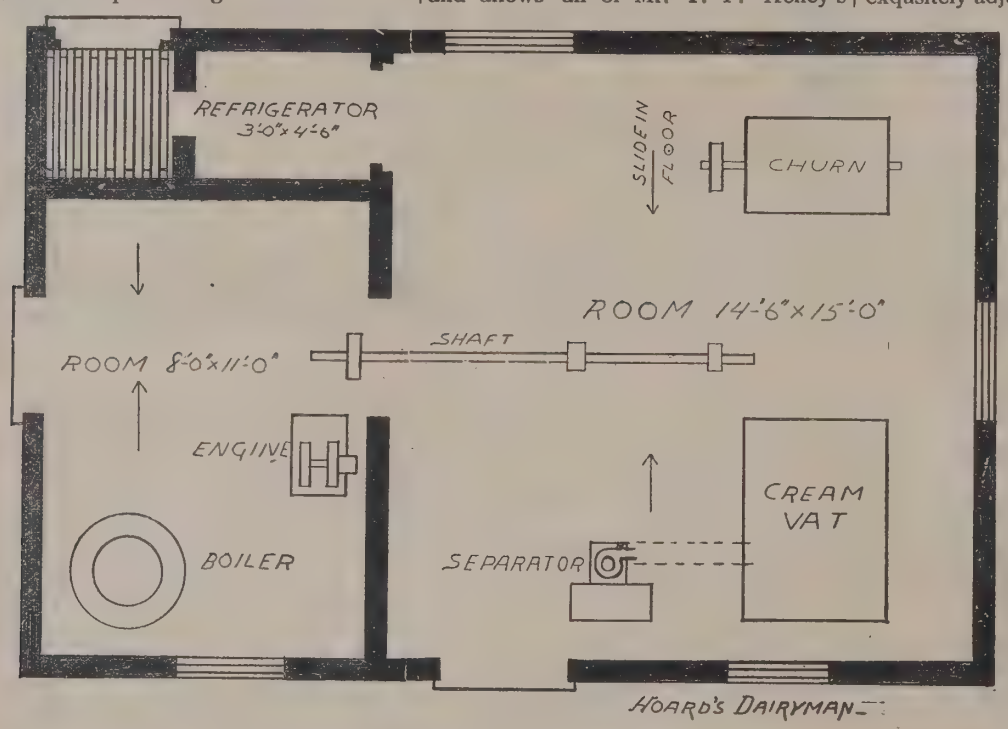
For the land's sake—use 'Bowker's' Fertilizers. They enrich the earth and the men who till it.

A Creamery for Twenty-five Cows.

ED. HOARD'S DAIRYMAN:—We expect to build a small creamery for a herd of twenty to twenty-five cows. How large should the building be? Would want room for a refrigerator, combined churn and butter worker, cream vat (600-lb. capacity), separator, milk tester, etc. How large a refrigerator should we put in?

What size boiler would be necessary to furnish steam for power, heating, washing, etc.? What size engine?



Would a gasoline engine be preferable or cheaper, using a stove for heating purposes? Would it do to put the engine in the creamery building and the boiler in a lean-to? Any suggestions from you or readers of the DAIRYMAN would be thankfully received. J. M. M. & SONS.

Shippenburg, Pa.

In response to the foregoing letter we present herewith a floor plan for an up-to-date farm creamery. The building is 16'×24', outside measurement, and has six-inch walls. It is intended to be only one story, and this should be not less than 9 feet in the clear.

The boiler and engine should be of sufficient capacity to furnish all the power required on the farm, such as sawing wood, pumping water, grinding feed, husking and shredding corn, filling silo, etc. In addition, it may be expedient to think about heating the house and furnishing electric light for house and barn.

For these purposes nothing less than an 8-horse power engine should be installed, and the boiler should be capable of producing 10 to 12-horse power.

GROUND PLAN FOR FARM CREAMERY.

On many accounts we should prefer an 8-horse power gasoline engine, and, if only the creamery is to be warmed and supplied with hot water, get a small heater or boiler, or use a stove as suggested.

We would prefer not to place the engine in the same room with the separator, cream vat and churn. It will be observed that the Babcock test is not located on the plan. Its proper place, in our judgment, is in the boiler and engine room, but if a hand machine is used, it can be moved about to suit one's convenience.

The floor of the creamery should have a gradual *slope* (not slide as the engraver puts it) towards the center, to a shallow open gutter leading to the sewer. Use only the best quality of Portland cement for the floor.

The Manure Question Again.

ED. HOARD'S DAIRYMAN:—I have watched with much interest the views expressed recently by different correspondents, on dispositions of stable manure. The subject, though a perennial one, is always interesting, because of its vital importance to farmers. As one of the fraternity I have had occasion to make a close study of the matter for a number of years, and have adopted the plan of hauling direct from the stables to the field at all seasons.

I cannot, however, endorse the plan of spreading in the winter months. It is much better to throw out in small piles at suitable distances for spreading, and allow it to remain until ready to plow in spring; this for several reasons: First, because these piles being of pyramid shape will turn most of the rain that falls upon them, and will not leach.

Second, because ground will dry much faster than if the manure is spread as hauled, allowing plows to start several days earlier. This last is a matter of no small importance, as we find the earlier plowing is done, the better for the crop and also for the teams.

I am aware that a man's circumstances and surroundings will, and should, have much to do with the plan he pursues, and that "local men have local ideas."

If I had come into possession of a farm already fixed with covered barn yard, or a very costly and complete manure cellar, or lived in a community where straw or other absorbents were not to be had cheaply, I might use these fixtures, but for the average farmer the cost in "cash" and "muscle" overbalances any gain to be derived from any extra manipulation.

As to whether the manure be applied on the plowed land or turned under, it matters but little. The main point is to get it there, and with as little "red tape" as possible. There are still a few ——— some one please supply a name for the fellow who feeds his cattle in the open yard and wheels the manure from his horses out and spreads it over the yard, and allows all of Mr. T. F. Kelley's "tannin" to leach away for a year, then hauls out the residue for his wheat crop. If I should do this, I should expect to get a financial "tanning" pretty soon.

I think the answer to Mr. Kelley's query about the liquid from his big 40-load heap is, that top of his large pile being somewhat conical, or roof-shaped turned the water off so that there was but little leaching to it, quite a different thing from being spread over the entire surface. O. W. GENT.

Maryland.

Clarified Milk.

Does Clarifying Change the Composition.

ED. HOARD'S DAIRYMAN;—By printing the "Inquiry for Mr. Marion" regarding clarified milk, I take it the reply is to be through your columns. I would like to know why dairymen shouldn't consider that knowledge is as much merchandise as apparatus is?

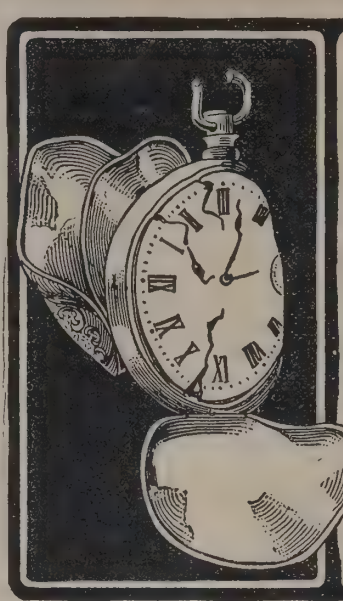
There remains yet some investigation to be done in the matter I referred to, to determine amounts and percentages, and so I'll not go into details at present. First he wants proof as to change of physical condition due to the centrifuge. Observation and comparison furnish it. It has also been noted by physicians. Perhaps a good answer is the regular "Yankee answer." Here it is: Does Mr. Palmer suppose it possible to subject milk to the strong tearing apart force of centrifugal separation and afterward be able to unite the parts so it is as good an emulsion as in untreated milk?

As one noted physician said, "can you make milk of it after it has been through the separator? It is all right to call it "modified milk" or "clarified milk," but it isn't milk."

His second question I'll answer in the same way. Does Mr. Palmer think the centrifugal force of the separator is so exqusitely adjusted, even if it was possible, that there is nothing but matter foreign to milk in the so-called "separator slime?"

Thirdly, Mr. Marion hasn't had any "experience in clarifying milk" and never expects to have, but has had a thorough schooling in keeping milk clean and free from odors and taints.

You say "clarified milk" and the question is immediately suggested, why clarified?



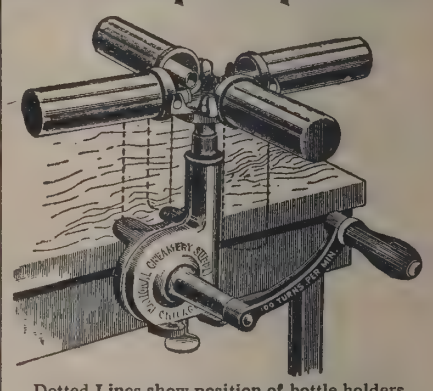
The term carries its own condemnation. Milk should not need clarifying, and as pointed out in the article he questions, this process is of less public benefit than pasteurization, and neither have removed the product of bacterial life whether it be only lactic acid, or some toxin, or something else. Any so called cleaning process for milk only sets a premium on unclean milk production. Milk produced under methods such as are outlined in the DAIRYMAN of Feb. 20th, removes the neccessity of clarifying and is better milk for all purposes and far superior for infant feeding, or use in the sick room. An individual, or company organized, supplying milk produced under such conditions would certainly win the trade, and with far less capital invested than in "The City Dairy Co. Limited."

Now in regard to the aeration of milk, as Mr. Palmer asks for information on the subject. He says: "milk not aerated is smothered." I know of a dairy where the milk is poured directly from the pail into the bottle filler and the caps snapped in the jars as soon as it is possible; and according to experts and the customers of that dairy "They never knew what milk was until they tasted that."

Yes that is a clean dairy and the cattle are fed sweet and wholesome food.

I believe when milk is produced in stables where there are strong odors and the cows may get food containing weeds or other matter that may taint the milk, aeration will improve the taste and smell of such milk. From a sanitary and biological view the way aeration is usually conducted is all wrong. Then it naturally follows that milk intended for cheese or butter "aerating does more harm than good," as flavor in these products is the result of the action of organisms made known by biology. So aeration, not removing the cause of bad flavors, is wrong.

The thing to insist on in milk production is sanitary conditions in the stable, and scientific cleanliness in milking and



Watch Accidents

will happen! That's why your watch works should be protected by a strong case. Gold alone is soft and bends easily. It's used for show only. The JAS. handling milk afterward.

Now Mr. Editor, I would like to call attention to another question involved in the city milk question that needs the careful consideration of all the large dealers receiving milk from many dairies; and also the boards of health. They should confer on the subject.

There is abundant evidence that there have been many epidemics spread by milk supplies. In such cases it has usually been traced to one dairy.

That means this, one thing should be done and always done.

The milk delivered on each route should be the milk from the same dairies, each delivery. The value of such a practice to the public is obvious. The value to the dealer is as great in a pecuniary sense. I won't elaborate for that too is obvious to the man that will see, and the man that won't, ought to lose his business, but it is hard on the public to have to run the risk until he does.

Mass. F. L. MARION.

Salting Cattle on the Back.

ED. HOARD'S DAIRYMAN:—I have a small herd of graded Jersey cattle, have a registered Jersey bull, and expect to improve my herd.

I use a Palmer barrel churn, and get 25 cents per pound for my butter.

I make nice clean beds of fresh pine sawdust for my cattle every day.

I do not believe in dehorning milk cattle or bulls. Dehorning produces muscle, the thing we do not want much of in milk cows. Dehorning decreases the courage and ambition of a bull and thereby lessens the purity and excellence of the breed.

I salt my cattle entirely on their backs. I do this for several reasons. The cattle take the salt as they want it. The salt clears the skin and improves the hair. Cattle thus salted not only lick themselves, but they lick each other, and this creates a friendly feeling among them. My horned cattle stand together in stalls without fighting, or injuring each other.

Lice and warbles will not stay on a cow that is salted on the back once or twice a week.

The ox-fly will not deposit its eggs on a salty back. Salt and sulphur sprinkled on hogs will keep off lice and mange.

I have been taking HOARD'S DAIRYMAN, for two years and cannot get along well without it. W. F. W.

Bowersville, Ga.

Good Returns from a Canada Farm.

ED. HOARD'S DAIRYMAN:—I have noticed a number of reports published in your paper from different farmers, so I thought I would tell you what I did last year on a farm which seven years ago would only keep 1 pair of horses and 4 cows. We kept nine cows, part of which were young. From the 1st of May 1901 to April 30th 1902, we sent to the creamery, 46,767 lbs. of milk, or about 5,196 lbs. per cow, which brought us $373.84, or $41.53 apiece. Count the skim milk at 20 cents per hundred and it would amount to $93.35, or an average of $51.91 per cow. Some people will say that 20 cents per hundred is too much for skim milk, but on that I fatted eleven pigs which brought $226.80, and I am sure the milk made at least half of it. This year we are milking one more cow and up to present have done better, so perhaps you will here from us again.

Quebec. ALONZO IMPEY.

Failure of the Farm Boy, an Experience.

ED. HOARD'S DAIRYMAN:—I notice an article, "A Bright Future for the Bright Farm Boy." Let me give a little of my experience on the subject. I have given years of study and practical work to master the profession of stock raising, making gilt edge butter and farming, to make farming profitable. I have had charge of two farms in the last ten years, that the owners told me they lost $900 and $1,200 in the last eighteen months. The first farm I rented; paid a cash rent for stock and all, and met my payments and had a little left. Then the owner wanted more rent and everything done up with a sand paper finish. He was a professional man living in the city and was unreasonable, so I gave up the place.

The next was a large farm and owned by a lawyer. He told me he had been losing money for some time when I took charge. I put on 25 cows, and raised all the hogs that the milk would feed judiciously. I employed more help, netted him over $50 per cow for butter alone, paid expenses and gave him $3,600 the first year. Did nearly $1,000 better the second and he was not satisfied yet, so then I quit.

Now with the above record and good recommends in answer to an add. in an eastern paper, I am offered $35 a month for myself and wife. Now I do not see much encouragement in my experience to master the profession and give your time to such men that seem to want a genii, at least such has been my experience to come in contact with so far. READER.

N. Y.

Poisoning of Cattle by Common Sorghum and Kaffir Corn.

During the past few years, the Nebraska Experiment Station has investigated the loss of cattle from eating green sorghum and Kaffir corn. The prediction of the veterinarian that a chemical poison would be found has been fully verified. While work was in progress, two English investigators discovered that prussic acid can be obtained from the Egyptian great millet. A little later and entirely independently, the Nebraska investigators discovered that prussic acid can be obtained from our common sorghum and Kaffir corn.

The poison is always present in at least minute traces, but becomes dangerous only when the plant is arrested by dry weather at certain stages of its growth. Sunlight, such as prevails in the arid and semi-arid parts of the country, causes the development of the poison in excess. When the symptoms of poison do not appear so violently as to make medical treatment out of the question, drenching the animal with a solution of corn syrup or with sweet milk is suggested.

Thoroughly cured Kaffir corn that had been especially deadly before harvesting, was fed to an animal without producing any symptoms of poisoning.

VETERINARY.

Queries in this department answered by DR. A. H. HARTWIG, Watertown, Wis.

Bloating.

I bought a yearling heifer two weeks ago. She was bloated badly when bought and has been bloated more or less ever since. Her droppings are too soft for an animal on dry feed. She eats well, but is dumpish and dull. R. H.
Oswego, Ill.

ANSWER.

This is a sign of indigestion, which is also proven by the unnatural condition of the droppings. Make a complete change in diet, feed such as is easy to digest and not too much at a time. Give plenty of salt to increase the thirst, and give in food, twice daily, a tablespoonful each of hyposulphite of soda and powdered ginger. If she will not eat it, you may dissolve it in a quart of warm water and drench.

Cough—Heart Troubles.

I have a calf that in shipping got a very bad cold and dysentery set in with it. She coughs some, if you rub her throat, she coughs a good bit yet; will she get over it or has she a deeper and more serious trouble? I have a cow; about three weeks ago she refused her feed; appeared like indigestion. She is getting very poor, eats part of the time as though her jaws were sore; have examined her jaws and can not find any sores; do not think she laid down in 48 hours till today she laid down. Her legs appear to be swollen; yesterday her lower jaw, beginning where the jaw bones come together and going towards the throat, was swollen terribly, then to the brisket and that was badly swollen. Her eyes are bright and she carries her ears up in good style, does not appear to suffer any. F. W. S.
Lowellville, Mahoning Co., O.

ANSWER.

1. Rub the throat with ammoniacal liniment once daily for a week and give a tablespoonful of honey or molasses on the tongue occasionally after meals; she will most likely soon recover.

2. We are inclined to believe that your cow has heart trouble, judging from the above symptoms. This may have been caused by swallowing some sharp object which sometimes works its way through the digestive organs into the heart and brings about the symptoms you mention. If this is the case you can do nothing better than to give good nursing and keep her strong.

Lump in the Teat.

I have a cow that during all the last milking period had a lump, the size of a hen's egg, at the top of one teat, and gave very little milk from that quarter. Can that be remedied after the next calving? Another cow which has the end of one teat lacerated, so that the milk comes out in a spray and leaks somewhat. It is now healed up. Could I cauterize it when the cow is dry, so that the milk would flow in the proper way? Another cow which will take the full every day if allowed, was so with the last calf which was born dead. E. W.
Merced, Cal.

ANSWER

1. The lump can be taken out as soon as the cow is dry without danger to the cow.

2. It is not safe to cauterize, as she will leak from the teat all the more. It is best to let well enough alone in this case.

3. The abnormal sexual appetite is due to a diseased condition of the sexual organs, the cause of which can only be ascertained by a personal examination.

Chronic Indigestion.

I have a registered Ayrshire bull that was taken sick about a week ago. He for the last two weeks has been eating very little. He seemed to gradually eat less at each feed until he stopped altogether, and for the last four days has not eaten any thing. I gave him Tuesday 1 lb. Epsom salts and 1½ ozs. ginger the day after. F. P.
Ellicott City, Md.

ANSWER.

We have not been able to draw a positive conclusion from your description, but are inclined to believe that your bull had chronic indigestion and that your physic was too severe and too long continued for the irritable digestive tract. The bicarbonate in tablespoonful doses would have been sufficient, with small feeds of easily digested food. An animal in this condition should have plenty of salt at his will to increase the thirst.

Warbles.

The so called "warbles" or "grubs" in the backs of cattle are very plenty and troublesome this winter. Please give a life history of this troublesome insect. N. S. F.
Berlin, N. D.

ANSWER.

Warbles or wolves as they are commonly known, are caused by insects depositing their eggs on cattle during the warm season, and the larvae develop in the tumors. When they have attained sufficient size, they escape and cause no further injury to the cattle except to decrease the value of the hide. Usually they can be squeezed out sufficiently to be grasped with a pair of small forceps and thus drawn out completely and destroyed by fire or crushing them under the foot. Care must be taken not to break them while pulling. The cavity may be washed with a solution of Zenoleum, 1 to 50 parts of water. The cattle may be washed occasionally with this solution during fly season, to prevent the insects from depositing the eggs.

Pigs with Rheumatism.

What will I do for pigs that have rheumatism, or stiff joints in the hind parts? H. T. R.
Crawford Corners, Pa.

ANSWER.

Please give description of your trouble so we may be able to form an idea of what the disease may be.

Lymphangitis.—Rectal Prolapsus.

I have a mare with left hind leg badly swollen on inside and very tender and sore.

I also have a pig about 4 months old with its rectum out about three inches; has been so for three weeks. A. J. M.
Anagance, N. B.

ANSWER.

No. 1. This is an inflammation of the lymphatics, sometimes called Monday morning disease, which is caused by high feeding during periods of idleness; this brings about an excessively rich condition of the blood, which causes a stoppage in the circulation, and inflammation follows. By the time you read this article, your horse will have passed the acute stage, and the swelling will have partially disappeared. The first step to take is to avoid all grain and feed hay and bran mashes only. Give the horse a physic, consisting of aloes 7 drams, and

Peculiar To Itself

Exile of St. Lambert

—13657—

is the sire of more tested Jersey cows than any bull living or dead, and the number to his credit will probably never be equaled by any other bull. His dam was one of the largest milkers among Jerseys, and is the dam of the three year old cow with the highest year's milk record for that age. Exile's sire is the grand sire of the cow holding the highest milk record for a year.

The mid-winter sale lists include a few tested daughters of this great bull and several cows and heifers deep in the blood that produced this famous sire. If you wish to improve your herd, or to start one, you will probably never have a better opportunity than is here offered. If interested write for lists, and please specify whether bulls, cows in milk, or heifers, are wanted.

WINTERGREEN HILL FARM,
Scottsville, N. Y

MEAD CYCLE CO. Dept. 216-C Chicago.

ginger 2 drams, give as a drench, or make into a ball and insert per mouth. Then rub the swollen parts with equal parts of mercurial ointment and lard once daily. You may also give a tablespoonful of sulphate of soda.

No. 2. The prolapsus must be replaced, but first wash the parts with warm water, and drop in it a little laudanum to prevent the pig from straining it out again. It is best to give one-half grain of morphine hypodermically. After the bowel has been replaced, you may inject starch gruel with a little laudanum, once daily into the rectum.

Blood Trouble—Inversion of Uterus.

Last summer I lost 2 calves; the skin would crack several places and blood would come out of each crack. They would lie with all four legs stretched from them and bleed all over, then after laying like this a few days they would die. I also have a cow that pushed the calf house out last time she calved. H. C.
Enumclaw, Wash.

ANSWER.

No. 1. Making a rough guess at your case, we believe your calves had some kind of blood trouble, but are not prepared to state positively that it is. Your information and description are insufficient to form an opinion.

No. 2. Inversion of the uterus is rarely repeated by any one animal, and it is likely that your cow will come right this time, keep her as near as possible in a normal condition.

Barrenness.

We have two cows that do not get with calf although served repeatedly by sure bull. One dropped calf Oct. 28th 1902. Seems to be in heat all the time. Have to keep her tied up or let out alone. The other cow is not so bad but does not get in calf. V. V. F.
Howell, Mich.

ANSWER.

If a cow is constantly in heat there is a diseased condition of the organs of generation which will require a personal examination by a skilled veterinarian who will be able to locate the cause and remove it.

Acute Indigestion.

Please tell me what is the matter with my calves. They fall, roll, kick and foam at the mouth, act just as though they had the fits. In a little while they seem to be all right, but it will come on them almost any time again. Wm. H. B.
Concordia, Mo.

ANSWER.

Your calves have acute indigestion, which, if allowed to continue, will become chronic. You are crowding your calves too fast, which brings about this trouble. Cut down the amount of food given and give a teaspoonful of bicarbonate of soda in food, or drench twice daily, and the trouble will soon subside.

Internal Injury.

A cow dropped calf about 3 weeks ago. At the time of calving womb came out the size of a large bucket; replaced it, since when she has continually declined until now she is a mere skeleton; she refuses to eat almost everything.
Springfield, O. C. O. S.

ANSWER.

The cow must have injured herself besides the uterine trouble, as the latter (if properly replaced) requires no further treatment. We should advise you to give good nourishment and the following powder in food morning and night: Powdered gentian root, 3 ozs.; dried sulphate of iron, 2 ozs.; sulphate of quinine, 6 drams; ammonium chloride, 1½ ozs. Mix and give one teaspoonful at a dose.

The Books are Free

Spavin Lump Jaw

You can cure Bone Spavin, Bog or Blood Spavin, Ringbone, Curb, Splint or any blemish hard or soft, Fistula, Poll Evil, Sweeny or Knee-Sprung, also Lump Jaw in cattle, with very little trouble or cost. The Special Dairy Cow in Nebraska.

[Address of J. F. Schlappi, of Lincoln, Neb. before the Nebraska Dairymen's Association.]

Mr. President and Bro. Dairymen:—One would almost feel out of place to talk on the Special Dairy cow here, since that phase of the cow question has not been agitated to any great extent. The idea has always been, and it does yet exist, to a large extent, that she must be "beef," or at the very outside, "Dual-Purpose capacity."

In my talk before this meeting last year, I touched on the Special Dairy Cow.

It must have been owing to the "Beef Breeders" meeting which was in session here about the same time that there were several "Beef" men present at the Dairymen's meeting, at least, one of whom had considerable to say that Nebraska was not adapted to the "Special Dairy Cow," and went on to explain at considerable length.

Now say, Brother Beef Breeder, we greatly prefer to have those fences of the proverbial kind, "Hog tight and Bull strong," for we would suffer infinitely more from the results, but at the same time you might be convinced that a good milker pays best.

Having now resided in the state over a year and more familiar with conditions regarding the dairy interests, and coming in contact with dairymen in nearly every part of the state I am more than ever convinced that the special dairy cow is as well, if not better, adapted to Nebraska than any other state. Not only am I certain of that, but the best evidence we have, though the dairy interest is in its very infancy, the enormous sums of money paid by the creamery companies of the state, not to say anything of the millions of pounds of butter made on the farm.

Here now, comes the suggestion, if the dairymen of the state are doing all of this with what we might call the "No Purpose Cow" how much better would the results be, if the "Special Purpose Cow" took their place.

We have proof from many sides, where men, and women too, have brought up the average of their herds to 300—350 lbs. of butter fat, per year, and more, and in one case a woman made the mark 400 pounds for the year. What some do, others can equal, and I want to see the day when every dairy cow in Nebraska will average 400 pounds of butter fat, every twelve months.

This may seem optimistic to you, but remember the world moves; only a short while ago the man who milked a cow was sneered at, by the fellow that did his milking on horseback, but today you find that very same individual has traded his broncho for a milk stool.

Am I making mis-statements? Am I guessing? The proof I have to offer is their own statements, for I have rubbed elbows with just that class of men for nearly a year.

To feed a cow a whole year to get a $20.00 calf or to do the same act with a selected cow, and receive for cream (if you don't want to make butter) at your nearest R. R. Station, from $35 to $75 per year, per cow, and raise a heifer as good as can be raised, on skimmed milk, and if a steer and you think him not the kind you want, dispose of him on the spot. Calf skin shoes are in demand, and with all this leeway it does not require the assistance of a reader of Blackstone to find the balance in favor of the selected cow.

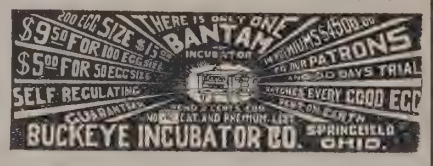
In an investigation among creamery patrons, which Ex.-Gov. Hoard, of Wis., is now, and has been carrying on for several years in HOARD'S DAIRYMAN, at his own expense, of thousands of dollars, not in the Eastern States only, but in Iowa as well, the invariable conclusions are in favor of the selected cows and a fairly balanced ration, to such an extent that in the creamery at Montrose, Pa., out of 50 patrons, twenty-five read dairy papers and twenty-five did not read and get in touch with modern ideas and methods, but note the sensitive part. The twenty-five who read dairy papers averaged $50.23 per cow, per year; the others who knew it all, of course, averaged $32.95.

Of course, there may be a "penny wise and pound foolish" excuse for the eastern dairyman in not feeding a balanced ration to his cattle, but here in Nebraska no excuse can be given for not attaining highest results, where the greatest forage plant in existance can be grown so cheaply. Now gentlemen, I want to ask you, why shouldn't the dairy business be

"ADVERTISEMENT".

SUPERIOR MERIT.

Remarkable Curative Properties of a Remedy for Indigestion and Stomach Weakness.



Stuart's Dyspepsia Tablets, a preparation for the cure of dyspepsia and the various forms of indigestion and stomach trouble, owes its great success as a cure for these troubles to the fact that it is prepared for disease and weakness of the stomach and digestive organs *only*, and is not recommended or advised for any other disease.

It is not a cure-all, but for any stomach trouble it is undoubtedly the *safest*, most sensible remedy that can be advised with the prospect of a permanent cure. It is prepared in tablet form, pleasant to taste, composed of vegetable and fruit essences, pure pepsin and Golden Seal, every one of which act effectively in digesting the food eaten, thereby resting and invigorating the weak stomach; *rest* is Nature's cure for any disease, but you cannot rest the *stomach* unless you put into it something that will do its work or assist in the digestion of food.

That is exactly what Stuart's Dyspepsia Tablets do, one grain of the digestive principle contained in them will digest 3,000 grains of meat, eggs or similar wholesome foods; they will digest the food whether the stomach is in working order or not, thereby nourishing the body and resting the stomach at the same time, and *rest* and *nourishment* is Nature's cure for any weakness.

In persons run down in flesh and appetite these tablets build up the strength and increase flesh, because they digest flesh-forming food which the weak stomach cannot do, they increase the flow of gastric juice and prevent fermentation, acidity and sour watery risings.

Stuart's Dyspepsia Tablets can be found at all drug stores at 50 cents per package.

ERIE CAN REFRIGERATORS should be used on all milk cans from April to Oct. Prevent sour and churned milk. Booklet free. S. C. SULLIVAN, M'f'g., Erie. Pa

Reid's Hand SEPARATOR

The "best" separator is that one which does its work most thoroughly and easily, that is built of strongest material, and that is most easily washed and kept in order.
First cost is a great point with a buyer, but ease of running, perfection of skimming and simplicity in washing are even greater considerations.
The **Reid Hand Separator** has but a single cylinder inside the bowl, and skims as closely as one-hundredth of one per cent. Indeed, some tests indicate "not a trace" of fat in the skim milk.
The Reid is perfectly planned and strongly built, and it literally "runs like a watch."
As to our guarantee of excellence, we make the strongest statement that can be expressed in words: **Money back (less freight) if the buyer is not satisfied.**
There is a new (free) booklet about the Reid Hand Separator.
Sizes run from 150 lbs. to 500 lbs. per hour.
A. H. REID
CREAMERY AND DAIRY SUPPLY CO.,
PHILADELPHIA, PA.

End Your Butter Troubles
with a **National Hand Separator** and make more and better butter from same quantity of milk. The National will do it easier, quicker and pay its cost in a very short time. We don't ask you to take our word—we send the machine for

and let it prove its worth right in your own dairy. *You take no risk*—we assume it *all*. If it does not meet your expectations, send it back—we pay the costs. Our catalogue tells more—write for it, it's free.

National Dairy Machine Co., Newark, N. J.

carried on, on the same principle as any other business in the land?

In all business carried on today the specialist is called for, and why, is very apparent. A person, no matter what his position or occupation may be, can and will be more proficient if one single purpose or one line of thought or work is followed. In other words he becomes an expert in his calling.

Let two men with two ideas, or two different occupations, start out with two other men, each one of the latter taking one of the ideas or occupations of the former, and the former will be so far behind, that sight will be lost of him before sun down, so to speak.

This holds true in every phase of life. The more we specialize and singleize, the more proficient will we become. Just so with the dairy cow. When you look for a cow that will be equally as profitable for beef as a milk producer, I can assure you that cow, or breed, does not exist; and as far, as I can see, it will be a very long time before that vacancy is filled. While we all have different likes, as well as dislikes, yet the one thing we are all looking for, without exception, is what can be expressed in dollars and cents. So, let us see what advantages are afforded in that direction by the special dairy cow. In the first place all will admit that the dairy interests are increasing in Nebraska more rapidly, perhaps, than in any other state in the Union, and right it should, for there is no place on earth where feed, and that of the most valuable kind for feeding the dairy cow, can be produced as cheap as here. Why is the dairy interest increasing in Nebraska? Because farmers have learned the certainty of its income. In a year of excessive moisture, as the past season has been, the uncertainty of crops is lost sight of for the time being; nevertheless, very many know with only too vivid recollections, the hardships during uncertain seasons. But how was it with the man who milked a few cows? He had not much difficulty in meeting obligations, and at the same time had plenty for his family to eat and wear.

While in Iowa last summer I became acquainted with a gentleman who gave me his history substantially, as follows:

"I was raised in Eastern Iowa. Father always milked a considerable number of cows. Whenever we boys asked for money we always got it. When I became of age I married and went west, to Cherokee county, Ia., bought a farm there and raised grain. For five years I raised each year a big crop of corn. When it was marketed there were always notes at the bank to be paid as well as store accounts to be settled; and when all was squared up, the corn crop was used up and winter before me with no money. I told my wife that this would never do, and that I intended doing as father did, to try dairying. I did so, and now ship cream to Sioux City, and receive my money every month in the year. Debts now are unknown, and we have a nest egg in the bank."

It is needless for me to enumerate the advantages derived from dairying. Every body admits that, but the time has come when we should pay more special attention to the business and derive larger profits than heretofore, in other words, specialize.

A good dairy cow will produce each year, from the time she is two years old (it is a good plan to have them become producers at that age, if possible) until the end of her usefulness, as much as she would sell for at any time during the year. But here is where the trouble comes in, to get the majority of farmers to realize (knowing that a dairy cow is of not much value for beef), that she has made him more profit than any other cattle could have done in the same time. I have sometimes said, and am still of the opinion, that we can afford to give her a decent burial at the end of her career.

Milk and butter values are high and are going to be still higher. I base my opinion on the rapid growth of the city, or consumer population, and the almost standstill (if not retrogression) of the producer in proportion to the consumer.

I anticipate you wish to ask, what breed shall we tie to for special dairy purpose? I will answer, any special purpose breed. There is no breed but what you will find some first-class individuals among them. Of course, you will find a very much larger per cent of good ones among the special dairy breeds and, therefore, I would say, choose the breed that you have a natural liking for, but above all you must select the individual to secure the best results.

In travelling over the state I see in almost every bunch of cattle some one cow, or may be more, with best of indications of a first-class dairy cow, and yet, the owner, in many cases, does not seem to think very much of her. The fact is, the animal has not had an opportunity to develop her best qualities,—feed and care are great factors in developing the dairy cow.

In breeding for special dairy cow you will always have a considerable per cent of them prove unsatisfactory; in other words, they have inherited the beefy tendency of some ancestor, and no amount of coaxing will convert them into anything different. But if you keep right on, raising the best from the best, you will be rewarded in a comparatively short time, in possessing a first-class dairy.

There is just one thing more along this line and that is, you may not be very enthusiastic at first, but as you progress you will find special dairying very facinating, as well as profitable. Just a word in closing, that will mean unquestioned success in the dairy business,—if any question or uncertainty arises, *ask* and *follow* the advice of the mother of your children. J. FRED SCHLAPPI.

Lincoln, Neb.

Pea and Oat Silage.

ED. HOARD'S DAIRYMAN:—I would say in answer to C. H. W., in DAIRYMAN of Feb. 13th, that I wet pea and oat silage if it has dry leaves or stalks or gets badly wilted after mowing. I don't cut silage into silo but put it in whole. Peas and oats are bulky here and settle slowly; we have to wait several days sometimes for silage to settle. In that case we wet down well when we stop. Our silage is in splendid condition. Have no trouble in getting it out. Can see no object in cutting into silo excepting that it will probably settle faster. We are feeding over 2.5 lbs. protein with grain, excepting what is in silage. W. J. LANGDON.

Washington.

Clover Ensilage

ED. HOARD'S DAIRYMAN:—In your last week's issue, C. H. R., of Newport, Vt., inquires for information in regard to the use of clover for silo. Last summer in June I filled one of my silos with clover of the mammoth variety. I cut the clover while in full bloom; had one team mowing, one horse raking, and four teams drawing the clover. I instructed the man that did the mowing, not to cut the clover any faster than the teams would draw it, as I did not want the clover to wilt. We run the clover through the ensilage cutter, cut it as fine as we could. I kept it well tramped down in silo and put on about 5 pounds of salt per load and kept it very wet, throwing on three or four pails of water per load. It kept very nice and the cows ate it readily, and did well, giving good returns in the milk pail. My silo is the round stave silo with cement bottom, which I believe to be the best. Clover silage requires more water than corn, as the clover gets very hot during the heating or cooking process, and unless it is kept very wet it will fire burn and turn white. I believe that good clover silage with a balanced ration of grain is better for milch cows than corn silage. E. R. W.

THIS RUNT

Weighed only 56 pounds when 14 months old.

This runt was farrowed April 19, 1900, and weighed only 56 lbs. July 20, 1901. On that day I began feeding it the Prussian Stock Food. I fed it twice a day for 60 days and then three times a week It consumed 12 pounds Prussian Stock Food. I sold it January 9, 1902 and it weighed 254 pounds—G. HINDS, Rockford, Illinois.

HOGS GAIN 3 LBS. A DAY.

John Herbers, one of my customers, fed Prussian Stock Food to his hogs that he was fattening and weighed them several times when feeding it and they made an average gain of three pounds a day to each hog.—Conrad Meis, Templeton, Iowa.

FATTEN HOGS AND CATTLE

AT THE SMALLEST COST. *Add a small quantity Prussian Stock Food to the regular grain ration of every animal fed. It conditions the stomach and bowels, purifies the blood, improves digestion and enables the animal to get the most out of feed consumed.* THE BEST FOR HORSES. Will put them in condition for SPRING WORK.

PRUSSIAN STOCK FOOD

DOES NOT TAKE THE PLACE OF THE RATION. It creates appetite and capacity for a full ration.

PRUSSIAN STOCK FOOD is Guaranteed to give satisfaction, when used according to direction, or the price paid will be refunded. If no dealer in town, write us. Tell us how many head of stock you have and where you saw this ad. and we will send you our 68 page Farmer's and Stockman's Hand Book FREE.

Cream SEPARATORS

All about them and other things for the dairy and creamery.

A. H. REID, - Philadelphia, Penn.

Beginning in a Small Way.

ED. HOARD'S DAIRYMAN:—Am a new man in the farm line, starting in to make butter at home in a small way, 8 cows now and will increase a trifle probably. Will you kindly tell me if you think it advisable to buy a hand cream separator for that number of cows? At present we are feeding the fore milk to calves, the butter milk to pigs, and churning the strippings and what cream we get from the fore milk. We have no good milk house yet and find it hard to keep the cream from getting strong, if we try to churn cream only. Bought a run down farm last fall, and am looking to HOARD'S DAIRYMAN especially to help us out. Kindly advise us as you see fit.

Mannington, W. Va. B. E. M.

There was a general concensus of opinion a few years ago that any dairyman having ten cows could not afford to be without a farm separator. More recently the opinion has prevailed that a farm separator would be profitable with even fewer cows.

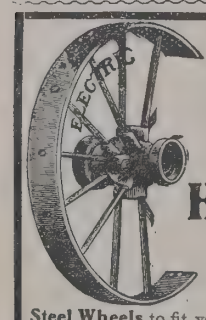
We cannot quite understand the reason for the cream getting strong, unless it be that there is no appropriate place for keeping it from day to day. But with the advent of a farm separator, we think this trouble will largely disappear and then there will be no question about "fore milk" and strippings, but the whole milk will be run through the separator and the warm, fresh skim milk given the calves. Keep the cream in some place free from contaminating odors, and if further trouble is experienced, write us more in detail as to conditions and we may have further suggestions to offer.

Grating over Gutters.

C. A. D., Rock Co., Wis., wishes information as to dimensions and kind of material to use for making the wooden grating mentioned on page 4 of the current volume.

CONCERNING OUR ADVERTISERS.

TRUE TO THEIR NAME.

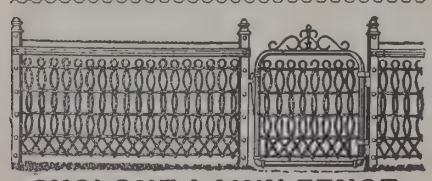


The Champion Harvesting machines are certainly true to their title, especially as they are represented in new machines for 1903. These machines retain all the new and distinctive improvements as well as the old points of advantage which have made this machine so popular in the past.

We do not hesitate to advise our readers to send direct to the Champion Division of the International Harvester Company for their handsome catalog, which tells in an interesting and convincing way the points of interest in this high grade harvester. The book will be mailed cheerfully upon application.

160 ACRES AN HOUR.

On one of the bonanza ranches in North Dakota a little incident occurred last harvest which illustrates with what nonchalance the natives view events that would create a furore in the east.



A binder expert was sent out from a big harvester plant in Chicago to look after a large number of binders that were in use on the big ranch. He ascertained that the machines would meet him at a certain crossroads at 8 o'clock on a certain morning. He managed to be on time at the place

A Low Wagon at Half Price.

The cheapest, the easiest and the best way to get a low wagon is to buy a set of **Electric Steel Wheels** to fit your farm wagon. If you don't want to bother with changing the wheels buy a set to fit your old gear. If you have no old gear you can buy one for a song, as there are thousands of them lying around the country. A set of **Electric Steel Wheels** costs less than one-half the price of a low wagon. They are made to fit any wagon. They make a new wagon out of your old one with wheels that cannot rot or break. Made with straight or staggered spokes, wide or narrow tires. Save blacksmith bills. Write for our **Handy Farm Wagon Catalog.** Tells about our full line of Electric implements. **It Is Free.**

ELECTRIC WHEEL CO.,
Box 130 Quincy, Ills.

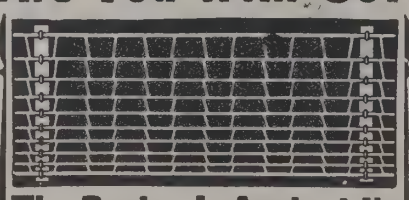
$28 FREE
FOR A TESTIMONIAL

You can have ripe tomatoes June 15th, ripe melons July 1st, new potatoes and cucumbers May 15th. All other vegetables or flowers as early by using Gold Mine Hot bed. It protects all kinds of plants from frost, cold raw winds and storms. Keeps off the bugs, insects, cutworms Stimulates plant life in such a manner as to make them grow three times as fast. Indorsed and recommended by every agricultural paper in the United States, and by every farmer that has used them. There is not a Tool or implement that the farmer buys that will bring him in as large returns each year as this. It will pay for itself forty times a year, with proper usage.

We have reduced the price from $1.50 per dozen to 85 cents, for immediate acceptance. Sold on the same guarantee to give satisfaction as plows, binders, and mowers are sold, or money refunded. When you find they are better than you expected them kindly send us a testimonial. Next year you will want more of them; we will reciprocate your kindness with a present.



We will give 200 Gold Mine Hot Beds to the person sending in the best report; 100 for second best; 50 for third; value $28, and pay all charges to destination. Premiums paid in November. Points considered—Earliness yield, amount of money made, with one dozen. Please do not delay your orders.

HEART OF CALIFORNIA

Alfalfa a specialty. Creameries on the Estate. Ample Railroad Facilities. Land Sold on Easy Terms in Small or Large Lots.

WRITE THE MANAGERS

404 GREAT NORTHERN BUILDING.....CHICAGO.

IT NEVER SAGS.

A fence that is perfectly woven out of wires of proper strength and full length, leaving no loose ends to unwind and injure stock.

THE HARTMAN STOCKADE FENCE

is a compact unit, made to turn the strongest and breachiest animal, yet responding to the requirements of heat and cold and always resuming its natural position. Made of the best galvanized steel wire, very heavy at top and bottom, all horizontals and trusses of ample strength. In seven heights, 18 to 54 inches. **A fence beautiful, strong and serviceable and of great permanence.** Write for free catalogue.

CUYAHOGA WIRE AND FENCE COMPANY,
DEPARTMENT D, CUYAHOGA FALLS, OHIO.

COMMON SENSE Calf Feeder

awarded **Gold Medal** at Pan-American Exposition. **The only Feeder** adopted by experiment stations. It is the kind others try to imitate. Easiest to operate and clean.

Most Durable, Simple, Economical, Scientific and Practical.

Do not be deceived by imitators. Shams are never imitated. **More Common Sense Feeders are in use than all others combined.** Over 50,000 in use. No valves to get clogged or foul. Nipples reinforced and cannot collapse. The calf feeder is a perfect weaner. A substitute for nature.

Extra gain on one calf pays for two feeders.

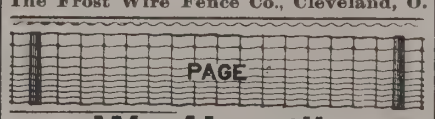
Best Feeder Made.
Michigan State Board of Health:—I tried every Calf Feeder I could find, but liked yours best.

Worth $10.00.
George S. Bement, Victor, N. Y.:—I am very much pleased with the Feeder and would not be without it for $10. No trouble, no damning, no milk on your clothes, no trouble to teach the calves to take hold of it, no sucking the cows, and the best of all is that when they get about eight weeks old they don't stop for the nipple but just drink out of the pail.

The Principle is Correct.
Purdue University Agricultural Experiment Station of Indiana, LaFayette, Ind.:—We have been using the Feeder to some extent and it is in constant use at this time and we believe it to be very satisfactory in its work. The principle of **Your Feeder,** I believe to be the correct one. C. PLUMB, Director.

Advise Stock Raisers to use it.
Maryland Veterinary Hospital:—I am very much pleased with the Feeder and would advise stock raisers not to be without one.

Price $1.50 including two nipples, sent postpaid for $1.75. We guarantee satisfaction, but if you are in doubt about its value we will send one on approval for 50c to cover postage, remainder to be paid if satisfactory. **Be Sure** and send for our twenty-two reasons why you should use a feeder. It's free. Sold by one dealer in a town.



O. H. MANUFACTURING COMPANY, DEPT. H, LYNDON, VERMONT.

INDIANA STEEL & WIRE CO.
BOX 511 MUNCIE, INDIANA.

designated. For some time no machines put in an appearance, but after waiting impatiently for about an hour he saw a cloud of dust down the road and the long line of Deering machines hove into sight.

Accosting the driver of the first machine, he inquired the cause of the delay, and that individual coolly answered: "Sorry to keep you waiting boss; but we stopped a little way up the road to cut a small piece of oats."

The "little piece of oats" amounted to some one hundred and sixty acres. It took just about an hour for that army of Deering machines to care for it.

THE SAMSON WINDMILL.

At the mammoth windmill plant of the Stover Manufacturing Co., Freeport, Ill., the largest factory of its kind in the world, are made the appropriately named "Samson" windmills, strong, powerful and storm resisting.

The Samson, Double-Gear Windmill, in addition to its ability to resist violent gales by its construction, is the one scientific wind machine built on a plan that appeals to every person who ever saw any "wheels go 'round." This double gearing, which is exclusive with the Samson and found in no other windmill, consists practically of two sets of gearing, or two pinions and two spur gears engaging each other, making two trains to transmit the power of the wheel to the pump. The sequel shown in actual service proves the double gearing to be one of the most valuable features in the entire theory of the transmission of wind power. The particular points gained by it are:

1. More than four times the strength of any other windmill using like amount of material.
2. Distribution of burden and diminution of wear by use of four bearings instead of one.
3. The lasting qualities are double those of any other mode of construction.
4. Its center crank, or both ends of the crank-pin driven instead of one as in other makes. No chance for pin to get out or work loose.
5. The pitman and plunger operate centrally between bearings, dispensing entirely with all over-hanging and torsional strain.

There is lots more of interest to be told about the Samson, and it is told in detail in a handsome illustrated book which The Stover Mfg. Co. will be glad to send to such of our readers as are interested and will write for it.

Hiles & Myers, successors to J. H. Myers, who has been advertising with us for some time have recently sold the farms of Eugene Solomon and F. H. Seavy in Marquette county and the farm of J. H. Liebe in Wood county. If any of our readers in Wisconsin wish to buy or have a farm they desire to sell they will find it to their interests to communicate with Hiles & Myers whose address is C 100 Mack Block, Milwaukee, Wis.

Keep your buildings well painted. If you don't do it because you want your buildings looking neat, attractive, do it as a matter of economy. No well kept and well managed farm goes without paint. There is hardly any expenditure that gives the owner more satisfaction than well painted buildings, and the dairy farmer has the help that may at odd times be employed in this work. On another page will be found the card of the Sieck Paint Co., of Chicago, whose business of selling paints by mail should interest our readers just at this time. They guarantee their paints and their catalogue contains a full line of paints and supplies. This company has been doing business in one place for over fifteen years and has the confidence of its thousands of patrons. If our readers want to do any painting this year we shall be glad to have them write the Sieck Paint Co. for their prices, and don't forget to mention this paper.

ORIGINATORS OF 30 DAY PLAN.

In another part of this issue we are printing the advertisement of the Kalamazoo Carriage and Harness Mfg. Co., of Kalamazoo, Mich. These people are the originators of the Free Trial Plan of sending vehicles anywhere with the privilege of 30 days examination and trial, the purchaser being perfectly satisfied before he accepts the vehicle. This plan was unique in its conception, and a good many dealers thought it was impractical but the quality of the goods that the Kalamazoo Carriage and Harness Mfg. Co. turn out justify them in making this very liberal offer, as they manufacture a fine grade of vehicles. Their business has increased very much in the past few years, and anyone who is interested in getting really a first-class job at the lowest prices should write to them for their free catalogue, which is now ready for distribution. Their address is The Kalamazoo Carriage and Harness Mfg. Co., No. 148 Ransome St., Kalamazoo, Michigan.

HOOD FARM
Antiseptic
Breeding Powder

Makes Cows Breed After Abortion. Corrects Failure to Come in Season and Failure to Clean.

"I had a heifer that aborted her first calf and she failed to breed again, though three different bulls were tried. I decided to give Hood Farm Antiseptic Breeding Powder a trial. After one month's treatment the heifer was bred successfully and in due time she gave me a fine heifer calf for which I have been offered $25." JOSEPH MASON, Bacon Farm, Newton Highlands, Mass.

Price, $1, sent by mail, $1.15. Size containing four times this quantity, $2.50. Sent prepaid for $2.75. Address

ILLUSTRATION.

THE DITTO FEED GRINDER.

Parties about to invest in a feed mill should take counsel of their better judgment and not buy one whose chief recommendation is its cheapness. In the end it will be found to be a poor investment. Though the same claims run largely through the entire feed grinder list, it is apparent from the variety in prices and other considerations that there are different degrees of worth, essential points of difference, which, if you could see them in operation side by side, would unalterably fix the choice on one or the other. We claim no originality for this thought. It is suggested by the strong invitation given by Mr. G. M. Ditto of Joliet, Illinois, to the prospective buyer on his free trial plan to place his triple geared ball bearing mill along side any and all comers, and to count his loser if it does not do faster grinding, run steadier, show less draft, more durability, more uniform feed and a greater variety of work. It is this mill which appears in the cut herewith. The essentials of a feed mill must all be comprehended in this statement. The Ditto guarantee says his mill will do 20% more work under like conditions than any other two horse sweep mills made. As the Ditto mills are shipped on five days free trial to all responsible people, we see no reason why a purchaser should not assure himself of being right by availing himself of the Ditto offer. It is a mill with a reputation. If not the best, it is one of the best mills made. Its first cost may be a trifle more than some mill you would be able to buy, but in the end you would not regret the investment.

ABORTION

Can be successfully treated with **Anti-Abortion Serum.** Easily administered and permanently cures. Information free.

RUPTURE CURED while you work. You pay $4 when cured. No cure, no pay. ALEX. SPEIRS, Box 346, Westbrook, Me.

Milking Machines.

ED. HOARD'S DAIRYMAN—Noticing an article in your issue of Feb. 27th, regarding a new milking machine, I was interested at once because if it will do its work thoroughly, it ought to be economical on any large dairy farm, but more especially because if there is any way of milking without exposing the milk to the dusty air and odors of a stable, it is very desirable from a sanitary standpoint.

This has been my study for several years in connection with producing milk for physicians use and for people who want clean, pure milk for the table. Among other methods tried was a closed pail and rubber tubes about 18 inches long with one end made large to go over the teats, the other end emptying into the pail.

The results the first few days were very satisfactory and we correspondingly elated. It looked as if we might be able to produce almost sterile milk and that as cheaply as ordinary milk is now produced. We know what asepsis means, and how hard it is to keep milk utensils aseptic, and we exercised especial care with those rubber tubes. After a few days the number of bacteria in the milk began to increase and the result was that that with all the aseptic precautions and antiseptic measures, those rubber tubes would bear, we couldn't keep them sterile. If we got them sterile, we destroyed the tubes very quickly.

This is all in accord with the findings of Dr. Ernest Wende, of Buffalo, N. Y., who after an extended study of the use of long-tube nursing bottles, showing the practical impossibility of keeping them sterile, and one year after prohibiting their sale, though the population increased, the infantile deaths decreased. That is the public health side of the question. The effects of running milk through rubber tubes, that is going to the creamery, would make pasteurization imperative because the lactic acid organism won't be the only germ found in those tubes.

This phase of the question is of as much importance to the manufacturers as to dairymen and the public; and in the interests of the public and dairymen and the manufacturers this report is made.

Mass. F. L. MARION.

Hot Milk as a Stimulant.

Hot milk is an admirable stimulant. Dealing with this well known fact, the *Lancet* states that milk heated too much, above 100° F., loses for a time a degree of its sweetness and density. None who, fatigued by overexertion of body or mind, has ever experienced the reviving influence of a tumbler of this beverage, heated as hot as it can be sipped, will willingly forego a resort to it because of its being rendered somewhat less acceptable to the palate. The promptness with which its cordial influence is felt is indeed surprising. Some portion of it seems to be digested and assimilated almost immediately, and many who now fancy they need alcoholic stimulants when exhausted by fatigue, will find in this draught an equivalent that will be abundantly satisfying and far more enduring in its effects. This should be taken note of by all hard-working people. —*Dairy World* (*Eng*).

Why don't you get a
Horseshoe Brand Wringer?
It will lighten your day's work
Every wringer is warranted from one to five years. The rolls are made of Para Rubber. They wring dry, last long, and will not break buttons. Our name and trade-mark is on every wringer and roll.

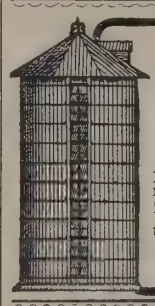
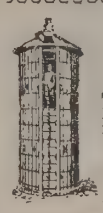
Sherman, N. Y.

Absolutely perfect. Soon pays the cost. Cheapest because best.
Water always fresh. Send for catalogue No disease where used.



Water In The Stable a Necessity.



It is universally acknowledged that stock in the stable should have constant access to water of suitable temperature, and all progressive Dairymen are putting in some form of Watering Device. Why not use the Best? Write for descriptive circular.
C. E. BUCKLEY & CO., Poughkeepsie, N. Y.

The Strength
of the coffee you buy adds to its value in the cup.
Lion Coffee
comes to you fresh and of full strength, always in sealed, air-tight packages. Bulk coffees lose their strength, deteriorate in flavor, and also gather dirt.
Uniformity, freshness and full strength are insured to users of Lion Coffee.

HARDWOOD TIMBER LANDS
from which the older trees have been cut but mostly covered with a fine growth of young timber, located in Marathon County, Centra' Wisconsin, are now offered for sale by us on most favorable terms to actual settlers.
This is some of the very best hardwood agricultural land in this state, with a deep, clay loam soil, gently rolling, with water easily obtainable at from 16 to 24 feet.
There is no better land for grain, grasses pastures, oats, peas, fruits or livestock, etc. Particulars will be furnished promptly on application.
RIETBROCK LAND AND LUMBER CO., Athens, Wis.

The
Economy Silo
Made of selected lumber, by skilled mechanics and special machinery. Continuous hoops—airtight—the best and cheapest. Write for illustrated catalogue and information.
ECONOMY SILO AND TANK CO.
1814 Market St., Philadelphia, Pa.

ROUND SILO.
...THE...
"PHILADELPHIA"
The only Perfect, Continuous Open Front Silo made. See open top patent roof. Ask for catalogue.

DULUTH, MINN.

A Discussion on Feeding.

ED. HOARD'S DAIRYMAN:—Agricultural Experiment Stations have done incalculable good to feeders of farm animals in developing the science of feeding. Prof. Henry has weighted animal husbandry with obligations upon which he can hope to realize fully only in the next world. No agricultural paper is alive to all the demands upon it, if it makes no provision for replying to inquiries as to compounding feed rations, and a live-stock or dairy paper that does not make a prominent, interesting and valuable feature of formulas for balanced rations out of all sorts of combinations of food stuffs, under widely varying conditions, in response to requests from its readers would be a back number, and yet in all that has been written and taught, there is little or no reference to a principle that is fundamental in the feeding of dairy cows, and in the proper understanding of which and the ability to apply it, practically rests the largest measure of profit.

For the better comprehension of my contention, let us make the very proper division of the subject into the science of feeding and the art of feeding, and in its considera'ion differentiate clearly between them. Scientists by analysis and experiments have determined the elemental composition of the animal structure. They have established principles and elaborated formulas to supply the waste incidental to its existence and use, and by so much, have developed the science of feeding.

This science is largely comprehended in "Balanced Ration," the standard for which owes its initiatory establishing and is primarily based on the average analysis of the rations fed by one hundred successful feeders of dairy cows in the United States — a standard that is being more or less modified or extended by experience and experiment. Of those one hundred successful feeders, it is altogether probable that there was not one who could make a calculation of the chemical analyses of the rations fed or who knew whether or not it was properly balanced, whether it was 1:6 or 6:1. They had acquired the art of feeding, with no knowledge of the science.

In the development and promulgation of the science the feeders art has been almost if not entirely overlooked—certainly so far as any persistent and material insistence upon the necessity for its acquirement is in evidence. In so far and by so much as teachers and exponents of the science of feeds and feeding have seemed to present as of primary importance the consideration of the cow as a dairy machine, and as such to be fed on mechanically scientific principles with humanitarian treatment as corollary, and have neglected to magnify the art of the feeder, or have, by indirection, tended to make it appear of secondary importance, just so far and by just so much have they overlooked a fundamental principle that should be given every possible emphasis in elemental and primary instruction in feeding.

It is comparatively an easy matter to enunciate a rule and supply figures for compounding a ration. The how to so apportion that ration as to best meet the individual requirements of widely differing animals cannot be reduced to formula or figures. Language cannot convey it; experience only can teach it, through constant practice only can skill in it be acquired—herein is the art of feeding.

Having acquired the ability to compound a properly balanced ration from the materials at hand, or by the help of the ever willing DAIRYMAN obtained a formula for the feed ration, the most profitable results possible can only be secured in its use through an intimate knowledge of the peculiarities of individual members of the herd. Peculiarties in assimilation, whether for milk or flesh, of digestion as shown in the voidings, in required quantity to secure the maximum product in the pail for the minimum expenditure of feed and animal energy.

Every reader hereof knows that weight merely is of secondary consideration in the feeding of his work horses, or even farm hands; knows that not infrequently those of equal weight, doing practically the same work, require very different quantity of feed to maintain equal condition. We have on our farm two outstanding illustrations of this fact. In each of two pairs of horses of practically the same weight as their mates, working on an evener with them is a horse that keeps in prime condition, kicks up his heels after a day that sends his mate soberly to the stable with no disposition for frolic or superfluous expenditure of energy, and requires, really won't consume over two-thirds of the grain and hay his mate actually needs to be kept in similar condition.

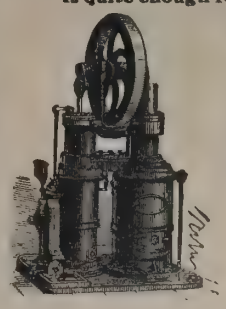
Can science or scientist disclose the why of this? Can he or it evolve a formula by which you can compound a ration equally good, pound for pound, for such differing individualities? Can the scientist, can you, Mr. Editor, can you, reader, formulate a rule by familiarity with which, inexperience can determine how by scale and measure to economically feed such varying peculiarities in individual horses? Workers of oxen know they differ as markedly. Those well advanced in skill in feeding milch cows know that it is equally true with them.

How is the feeder to know how to feed which? The "Feeders' Column," "Answers to Inquiries," "Wanted to Know," or what not columns in the dairy papers don't tell us, or except barely suggest the necessity of knowing in the occasional hedge of "judgment should be exercised" when supplying a formula for properly compounding a ration out of available food materials. Professors of feeds and feeding leave too much to the imagination in the meagre hints they offer in this direction, present almost no suggestion of the intense determination that is required, that is absolutely essential to completest success, to know from day to day, from feed to feed, just the quantity of grain and forage required by each individual cow in the herd to so keep appetite on edge as to compel consumption of requisite material for proper maintenance and largest flow of milk consistent with commercial economy.

The necessity for acquiring the art of feeding has received scant, if any, emphasis and its fundamental principles singularly overlooked, if indeed their importance has been at all recognized. Certainly in the publications incident to the development of the science of feeding there is no evidence of a just appreciation of the art required in application of the science if justifiably expected results are to accrue. A habit of generalizing to cover all sorts and conditions, has taken such possession of teachers and writers that they do not, as a rule, emphasize as they should distinctive factors that control highest results. In times of close competition and narrow margins "generally" will not count except for

OSTRICH LOGIC.

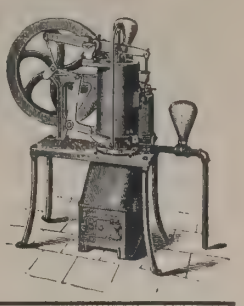
"When I can't *see* danger there is no danger." That's the logic of the ostrich which hides its head and exposes its body to the hunter. There are not a few people who seem to have gone to the ostrich to learn logic. The most dangerous enemies of humanity are the enemies which can't be seen, the disease breeding microbes which infect the blood. It is harder to get the microbe out of the blood than to keep it out, but Dr. Pierce's Golden Medical Discovery does both, by purifying the blood and then keeping it pure.



If there are eruptions on the skin, boils, pimples, sores or other signs of impure blood, use Doctor Pierce's Golden Medical Discovery, which will purify the blood and cure the eruptions which come from it.

"My blood was all out of order, and I had to go to the doctor," writes Mrs. James R. Moss, New London, Stanly Co., N.C. "He gave me medicine which helped me for a short time. In the winter of 1895 I got worse than I had ever been. My tonsils were enlarged and my neck swollen all out of shape; my throat was sore and I could not cure it. My husband went for the doctor, but he gave me no encouragement. He helped me a little, but it did not last long. He attended me for twelve months, when I heard of a lady whose condition was like mine, who was taking your medicine and was getting well. So I secured some of the medicine and began taking it. In one week I was able to do my cooking. When I began taking the medicine I could sit up only a few minutes at a time, and I could rest or sleep only a little while at a time. My throat was so sore at times I could not even swallow sweet milk, and my tonsils were full of little eating sores. My left side was swollen out of shape and I could hardly get my breath. The doctor said I would not get well, but three bottles of Dr. Pierce's Golden Medical Discovery, three bottles of his 'Pellets,' three bottles of Dr. Sage's Catarrh Remedy and the use of salt water did the work and cured me."

Dr. Pierce's Pleasant Pellets cure constipation and its consequences.



HALF ENOUGH WATER

Is quite enough for some people, but most people want water every day. If

RIDER or ERICSSON HOT AIR PUMPS

Are used you can have water every day in the year, and your cook or stable boy is the only engineer needed. 25,000 in daily use. Catalogue "B 5" on application to nearest store.

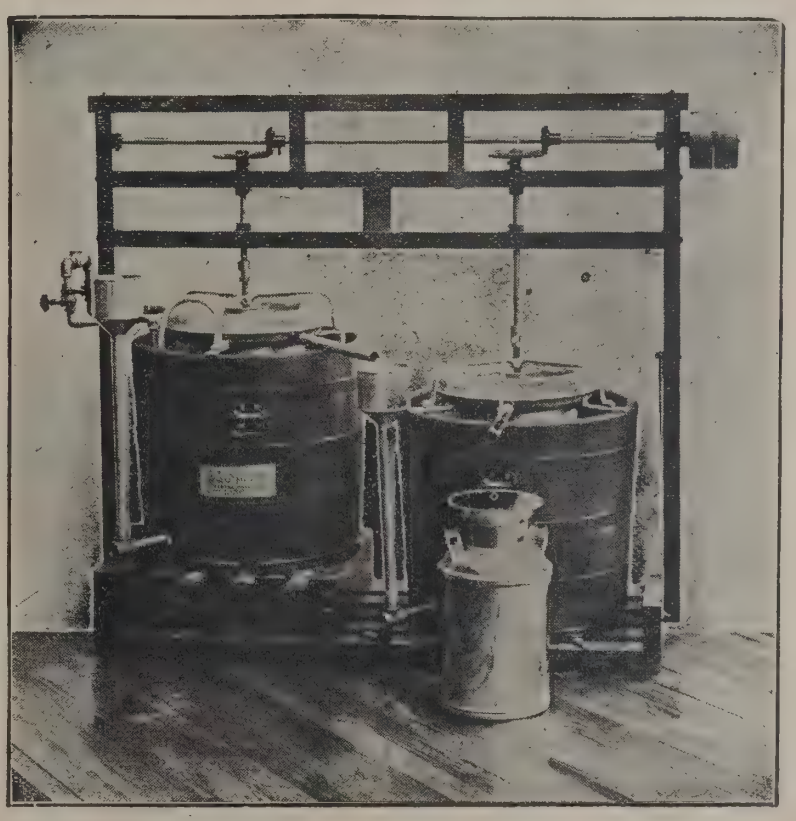
The Right Start

"Well begun is half done" when it comes to economical harvesting. One distinct advantage in using

Plano Harvesting Machines

Is their remarkable freedom from breakage.



Their simplicity, as well as ingenious and thorough construction, contributes to this — prevents many vexatious and costly delays. The simple PLANO KNOTTER illustrates it; comprised of only 16 pieces (about half the usual number) it has made the highest record ever made by any Knotter for unvarying accuracy and durability; it ties whole harvests without missing a sheaf.

The *Plano Binder* has many other interesting points it pays to know about, such as its self-regulating Fly-Wheel, Reel with safety Friction Clutch, etc.

When you buy a *Plano Harvester, Mower, Header, Reaper, Rake, Corn Binder* or *Husker and Shredder*, you are insured against a lot of trouble and expense. Our catalogue tells how and why; ask for a copy; it's free.

PLANO DIVISION
International Harvester Co. of America
CHICAGO, ILL.

A GREAT SUCCESS.

Price $150 in Tin. $200 in Copper.

THE MILLER PASTEURIZING MACHINE CO.
CANTON, OHIO.

possible failure, and "average" margin may mean bare escape from financial loss. No individual cow in a herd should be permitted to become a charge on the most profitable, even if the average shows a profit, (this is not original or new but it will bear increased emphasis). Even if every individual in the herd is made to yield a demonstrable profit on the expenditure properly chargeable to *her* account, the average of the whole is not liable to be such as to inspire socialistic legislation, to distribute the accumulated wealth acquired in dairy husbandry.

Something more is required than ability and training to compound a balanced ration, weigh the cows, calculate the quantity of dry matter, carbohydrates and protein each should have, dump the ration into the hopper and sit down at the other end of the machine to draw off the product. Any man who can read, write and cipher, knows which end of a cow goes next the manger, what, when and how to pull to secure the product, can run a milk machine if he will study and observe the scientific rules for such purposes made and provided. Whether or not he can keep the machine in order to turn out the maximum quantity in proportion to its capacity every day, and show a profit, may suggest a cow of another color.

Editors and professors should add still farther to the almost snowed under accumulation of obligations they have put upon the dairy industry, by insisting in season and out of season upon the necessity of feeders knowing by careful observation of individuals day by day, from feeding to feeding the specific results in detail and their accurate tabulation for future comparison and suggestion. Hammer away with increasing din till fuller appreciation is realized of that art in feeding of which the science is the superstructure rather than the foundation. They should set forth in the class room, from the platform and through the columns of dairy and stock journals, with the skill and completeness for which their training and equipment should fit them, the value and method of acquiring the habit of observation that tells the skillful feeder almost intuitively at each feeding whether a full, a diminished or increased ration is best for each cow, what use is being made of the food consumed, whether to add weight to the carcass, passed in the voidings, or for profit by way of the milk pail, that shall acquaint him with the peculiarities of individuality that determine the measure of profit or loss from each, and to know not merely how to make her profitable, but how to make her most profitable, regardless of comparison with averages.

GEO. T. VAN NORMAN.

Massachusetts.

Rye for Silage.

Mr. G. W., of Philadelphia, Pa., finds that he needs two copies of the DAIRYMAN, one for himself at home, and another for the superintendent of his farm, at Wawa, Pa., where they are feeding about 200 cows, and find that, although a large quantity of ensilage was put away last year, it is likely to become short before ensilage time comes around again next September. He writes that he has a large quantity of fall rye growing, and could very well supplement his stock of corn ensilage with rye cut in the spring. He asks whether there would be any objection to feeding rye silage, cut before the maturing of the head.

We are not prepared to advise the attempt to store rye in a silo. The secret of success in making silage is to exclude the air and thereby prevent, or at least control, the fermentation. Rye and other hollow stemmed varieties of grain would carry a large amount of air with them into the silo, and it would be practically impossible to displace it, we fear. At all events, attempts in this direction have hitherto proved unsuccssful. However, if any of the readers of HOARD'S DAIRYMAN can quote experience to the contrary, we shall be very glad to hear from them, as this is a matter of very considerable importance.

Samson Windmill Stronger than The Storms

WHEN YOU BUY A WINDMILL

You buy it for a long time and your money entitles you to the best. No other piece of machinery has as much constant wear. The mill that stands the weather—fair and foul—365 days and nights in the year must be built right or go to pieces. Better buy right once than wrong many times. Our

Samson Double Gear Windmill

is the result of years of study and the expenditure of large sums of money, which have produced a perfect mill. The **Samson** is the very acme of windmill construction. All others are merely windmills; the **Samson** is more than a windmill—it is a wind *machine* built on scientific principles that place it far and away ahead of all others.

Among its many **strong features** found on no other mill, stands most prominently its **double gear**, which in reality is two sets of gears or two pinions and two spur gears engaging each other, and making two trains to transmit the power of the wheel to the pump. This feature is the most valuable one ever incorporated in a windmill. With its four bearings, in place of one, the strain of the load is distributed to four points, giving the very minimum of friction, resistance and wear, and the maximum of power and endurance and doing away with all overhanging strain. This double gearing and its bearings retain their rigidity and tightness under all conditions. The **Samson** has five times the strength of any other windmill using a like amount of material and at the same time is the lightest running of any on the market. Other points of superiority are many, among them durability, high-grade material, skilled workmanship on all parts, easiness of running in slightest breeze, detachable boxings, perfect brake and governor, double pump rod and guide, wick feed oilers, etc. You should know more about the **Samson**. We tell the story in a beautifully **illustrated booklet** that has cost us thousands of dollars to print. It is yours for the asking. Write today. You will be glad if you do.

THE STOVER MANUFACTURING CO., - Dept. P, Freeport, Ill.

SAVES ITS COST ON THE FIRST CROP.

It spreads all kinds of manure, lime, galt, ashes, compost, etc., either broadcast or in rows. Does it better than it can possibly be done by hand.

Do you know of any other piece of machinery for use on the farm of which this can be truly said?

The Improved Kemp Manure Spreader

not only makes easy work of getting out the manure, but by the way in which it breaks it up and makes it fine, it more than trebles the value of the same. It will break up and spread evenly, manure that cannot be handled with a fork. It doesn't matter how hard, lumpy, caked, strawy, or stalky the manure is, this machine will spread it. It makes fine, well rotted manure go a long ways in top dressing wheat in the spring, meadow lands, pasture, etc. Being mounted on broad faced wheels, it can be handled on any kind of ground without serious cutting in or rutting. Can spread back and forth, as front wheels turn entirely under. Can be turned on the ground it stands on. 1903 machine has our new **Beater-Freeing Device, Apron-Returning Device** and numerous other improvements. Send for latest catalogue (free) and read about these and other advantages and also about **"How to Grow Big Crops."** Remember that the only original and genuine Kemp Manure Spreader is made by us and the patents thereon have been fully sustained by a recent decision of the U. S. Circuit Court. KEMP & BURPEE MFG. CO., BOX 48, SYRACUSE, N. Y.

New American Manure Spreaders

hold from 50 to 100 bushels. Spread just as thin or thick, fine or coarse, as ground requires. Don't have to stop team to make change. Most substantial, largest capacity, lightest draft.

Send today for Booklet B.

American Harrow Co
Detroit, Mich.

The **KEYSTONE** Dehorning Knife makes the dehorning of cattle simple and easy. Operation over in an instant; but a moment's pain. Clean, smooth, clear cut, with no bruising or crushing. Highly valued by stockmen. Fully warranted.

ZAEGEL'S SWEDISH ESSENCE A LIFE PRESERVER

TRADE-MARK REGISTERED.

This remarkable medicine by *removing disease germs from the blood* has an action that effects the entire system. It tones up the stomach and creates an appetite; works on the liver and has a mild continuous effect upon the bowels, thus cleaning out the entire system; it makes new, rich blood, regulates the heart and kidneys and rids the body of all waste matter. It also induces a gentle perspiration, thus preventing fevers and congestion. Rheumatism, backache and headache, biliousness and all nervous diseases are rapidly cured, as well as diseases peculiar to women.

TRY IT FREE

No one need trouble themselves to doubt whether this remedy will do all these things, for you can have a free trial package first and see what it does for you.

Do not neglect to get in your application at once. The best way is to sit down this minute write a letter to M. R. Zaegel & Co., P. O. Box 989 Sheboygan, Wis., and say that you want a trial package of Swedish Essence of Life. This will be sent you by mail and is large enough to convince you of the merit of this celebrated household remedy. A 2-cent stamp should be enclosed in your letter to pay the postage on this free sample. **Write for it to-day.**

The Most Power for the least money, for any purpose on the farm, can be secured from our **Fearless Railway Horse Powers.** We make them for 1, 2, 3 and 4 horses, with speed regulators. Unequalled for Cutting and Grinding Feed, Sawing Wood, Threshing, Pumping Water, etc. Also make Threshers, Engines, Feed Cutters, Silos, etc. *Illustrated Catalog Free.*

"A BOOK ON SILAGE"

By Prof. F. W. WOLL

of the University of Wisconsin. Revised and up-to-date, neatly bound into a volume of 224 pages. It embraces full information from planting to feeding the crop, and includes working plans and specifications for building all silos. Also embraces:

I.—Silage Crops. II.—Silos.
III.—Silage. IV.—Feeding of Silage
V.—Comparison of Silage and other Feeds.
VI.—The Silo in Modern Agriculture,

And illustrations and complete plans for round and rectangular silos, dairy barns, tables of compounded rations, etc. **Mailed for 10c.** coin or stamps.

SILVER MFG. CO., Salem, Ohio.

Vicious Hand Separator Advertising.

ED. HOARD'S DAIRYMAN:—As a friend of the hand cream separator, both for the farmer and for the creameryman, I think it is proper to take exception to some of the advertising that is done by the separator manufacturers. I have in my hand a very neat folder gotten out by one of the largest separator manufacturers, and in looking it over carefully I find where the author is pointing out the leaks of the dairyman. Among other things, I find this: "There is a hole in the bucket when he makes a trip to the creamery every day instead of twice a week."

At every dairymen's or butter-makers' convention and in the dairy papers we continually see the hand separator agent getting flogged for telling his customers that it is necessary to wash the separator only once a day or perhaps two or three times a week. Nothing, seemingly, could be more vicious or detrimental to good butter making than such advice but when we see advice, such as the above, coming directly from the poor agent's headquarters we should feel that the agent is open to forgiveness.

I seems that many hand separator manufacturers are getting decidedly overanxious to do business and in their anxiety put such things in their advertisements. We all know that it is difficult enough to make gilt edge butter from hand separator cream, and it is also difficult enough to get the farmers to deliver their cream as often as they should without their being told that twice a week is often enough.

It is an admitted fact that the making of good butter must be done at the creameries, and it is a matter of constant effort on the part of the buttermakers and the creamery managers toward educating the farmers to produce a first-class article in the way of milk or cream from which to make fancy butter. Then the hand separator people come along and tell the farmers to do just what he has been made to believe he should not do, and there is no end of trouble.

We hope that the hand separator manufacturers may be able to sell their machines on their own merits, without teaching users to adopt methods that will certainly be detrimental to good butter making. G. S.

Pioneer—

One who goes before; a leader —Webster.

We are pioneers. Pioneers in the manufacture of pure vegetable parchmen paper. Like all pioneers, we have been followed by others. Most of them claim to make as good parchment paper as the "Paterson." We think that about the highest compliment that could be paid our

Pioneer Brand

Parchment Paper.

Ours is the kind that taints nothing by contact. It is stronger when wet than when dry. It's absolutely unequaled for packing print dairy or creamery butter. It shuts out all destructive germs and vile odors and shuts in all the natural sweetness and flavor. It keeps butter longer and better than can be done by any other convenient means. It preserves the butter and your reputation as a butter maker at the same time. We print your name, dairy, creamery or private trade-mark and brand on every sheet. Write for sample sheets and booklets. Be sure to get our booklet, "Better Butter." We send it free.

FREE BOOK ABOUT WINDMILLS

When you want a Windmill, don't buy the first you see. Learn all you can about them. Read our book.

We have a book that tells all about windmills. It begins with the Dutch windmills of 1400, and ends with the Aermotor of 1903. It contains 125 pictures to show you what windmills should do and what they should be. It tells all that invention has done for them. When you read this book you will know all that anyone knows about windmills. You will know the right kind from the wrong kind, and know all the differences. To avoid a mistake, don't buy without reading it. The book is free—simply write for it.

THE HISTORY OF AERMOTORS

The writer of this book is the maker of Aermotors. He tells you how he started 15 years ago by spending a fortune in experiments. He tells how he eventually made a wind wheel that is perfect; a wheel that gets power from a zephyr; that works when all other wind wheels stand still. He tells how he developed the modern windmill. How he originated steel towers, and how he perfected them. How he devised the labor-saving machinery that makes Aermoters cheaply; that makes them cost less than any other windmills worth having. He tells how in 15 years he has dotted the earth with Aermotors. How he entered a field overcrowded with rich makers and captured over half the world's trade by making a windmill with which no one could compete.

This book also tells about Power Aermotors for doing all sorts of work—for grinding, for sawing, for cutting feed, shelling corn and running many kinds of machinery. Also about Pumps, Tanks, Substructures, and all kinds of Water Supply Goods.

COVERED BY FIFTY-FIVE PATENTS

When you know all about windmills you will buy none but the Aermotor. That is why we publish this book. We learned what it tells you before we made the first Aermotor. We learned it by making 5000 accurate experiments with 65 kinds of windmills. We have proved to a certainty just what is needed to get the utmost out of a windmill. We have discovered some hundreds of facts that no one else knew, and we have covered our discoveries by 55 patents.

We thus make a windmill that gets power from the slightest breeze. That is why the Aermoter is known as "The wheel that runs when all others stand still." We make a windmill that regulates itself; that calls for no attention, save oiling. In a zephyr or a gale, the Aermotor pump maintains the same speed.

THE AERMOTOR COMPANY KNOWS WHAT IS BEST IN A WINDMILL

It is not a difficult matter to make a windmill. They have been made for centuries. It is, however, a difficult matter to make the best that can be made. To do that requires peculiar skill and ingenuity. The Aermotor Company, alone, has shown remarkable originality or genius in the business. It has had more experience than all others combined in making steel windmills. Isn't it fair to conclude that it knows what is best in a windmill? The best costs no more than an inferior imitation. If you buy anything less than the best you do not get the most for your money.

HANCOCK DISC PLOWS

The Plow Everybody is Talking About.

THE CELEBRATED

HAPGOOD-HANCOCK

Disc Sulky & Gang Plows

Changes the old method of plowing as the twine binder did the old method of harvesting. We guarantee to do more and better work with two horses on sulky, or three horses on 24-in. Gang, than any other Mould-Board or Disc Sulky with three horses, or Gang with four horses. No Mould-Boards, Shares, Landsides or Rolling Coulters to wear out or keep in repair. Will plow hard dry ground where no other plow will work. We want you to see it in the field and will give **liberal discounts on the first plow** and special inducements to help us introduce it in your neighborhood. We are exclusive mfrs. for two-thirds of the U. S. of the genuine **Hancock Plow,** the only plow branded or advertised as **Hancock.** Beware of cheap imitations that look like our plow, but which lack the essential elements (covered by our patents) that make the Hancock Plow a wonder and the only successful Disc Plow on earth. Write us now. Address

HAPGOOD

HAPGOOD PLOW CO., Exclusive Manufacturers, Box 572, ALTON, ILL.

Reproduction of a photograph showing part of solid

trainload of Tubular Separators shipped to customers west of Chicago.

Another Railroad Accident.

ON FEBRUARY 7th., 1903, that antiquated exponent of "hasbeenism", the once notorious "Disky Valwinkle Munchausen", while indulging in one of his favorite pipe dreams of 'steen hundred thousand separators sold (in his mind) chanced to loiter for a few moments on the main line of Cream Separator Progress and was struck by the **Sharples Special**, a through train consisting of twenty-four carloads of the famous **Tubular** separators enroute to western customers, —the largest single shipment of cream separators ever made. Poor old "Disky Val" was knocked high into the air, but finally hit the earth with a dull sickening thud which might have been worse but for the fact of his being in his normal condition of hot air inflation. A good bit of the wind was knocked out of him and it took him nearly four weeks to catch his breath again. His first statement evidenced his inability to comprehend the magnitude of this trainload of **Tubular** separators and his belief that it was all a horrible nightmare. It is really pitiful to witness the old fellow's gibberings about "nailed up cars", "hot boxes", "six months' orders", etc., all indicative of his rapid decline into second childhood. The effect of the blow can be better appreciated if the reader will observe that he momentarily ceased to prate about what "he used to do" and took up the song of what his distributing agents for Nebraska and Kansas are "going to do" (perhaps).

The enormous sale of the Tubular Separators is not maintained by extravagant tales of what we used to do nor of what we are going to do, but by virtue of what a superior machine it is "Right Now." This trainload shipment applies neither to the past nor the future but is just what we claim,—the first and only solid train load of cream separators ever shipped;—twenty-four cars in all, each one containing more than twenty-four thousand pounds of Tubular Separators, as the railroad records will show. It is perhaps difficult for our "has been" competitors to believe that a special train load of separators in addition to our regular car load shipments from day to day could be gotten together. It is only made possible by the overwhelming superiority of the Tubular separators which has built up the largest and best equipped cream separator works in the world.

Another Man Who Bettered His Conditionby Using Good Dairy Sense.

ED. HOARD'S DAIRYMAN:—I subscribed for your paper several years, and always found it useful and interesting. It was the means of my having more cows and better cows than I had before. Reading your paper, and also the feed question as discussed through it's columns in such a way, and to any one that was not fast in the old rut, could by trying for himself make several times the price of your paper in an increase in milk and saving of feed.

I have a retail milk route in the city of Trenton, and I wanted if possible to have the best milk sold in the city; in order to do that I parted with my general-purpose cows as fast as they were milked out, and put Jerseys in their place. I, of course, knew very little about Jerseys, but I supposed there must be difference in them, so in order to get a better understanding, I began with the *Jersey Bulletin*, which I think a very good paper, particularly the purpose it aims at, viz., the Jersey first, last and all the time, but to be candid with you, I think your paper gives a more practical view of dairying; it shows through its columns the difference in herds, and the keeping of them that must be a benefit to some.

It is a pretty hard job to change some farmers' methods, as I think you have found out before this. My first effort in Jersey line was buying Idle Eve and her two heifer calves, paying $120 for them. My neighbors thought I had lost my reason; they knew I had lost my cash, they said. She was fresh, calf about two weeks old; I took the calf off and raised it and began milking her. I tried hard to make it home for her. She gave for me 32 pounds of milk a day, for awhile; that was in March, 1901; in May of that year, she gave 228 pounds in seven days, in June, for 30 days, 864¾ lbs., and for the year, 8998 lbs.; she has never been dry. "I can't dry her up;" she has never had a bull calf, her last calf being a fine heifer by Matilda 4th Butter Bull, due to calve again the 13th. March; milking 10 pounds a day now. She has in the two years paid for herself over again several times. Her first heifer, Regal Eve H. R. No. 159090 is by Regal George, a St. Lambert, is due to calve again June 29th, 1903; is now giving 16 pounds per day. She is a beautiful orange fawn, black points, square udder with teats on each corner. Have been offered $100 for her.

My second offense was buying the bull, General Ewing, by Matilda 4th Butter Bull, dam Signalana by Signal, "a cow," a Jersey cow that Ihave seen give 20 quarts dry measure in two milkings. Since then I have bought several and bred some. My herd is now averaging 8 quarts per cow in this weather, zero or below, for the last week and eight inches snow on the ground. I read of some that makes this look small, very small, but I am milking and selling for eight cents per quart, between 170 and 180 quarts each day which I think fair for a 70-acre farm with 22 cows. Heifers,9 not in milk; horses 5. The farm raises all feeds except bran, gluten and flax.

You asked in your letter to hear from me, but I know you will be surprised to hear so much so I will stop. I do not think there is a better paper printed than HOARD'S DAIRYMAN. I read it nearly every week. A. M. HELLINGS.

Trenton, N. J.

Abortion—Sweet Clover in Alfalfa.

ED. HOARD'S DAIRYMAN:—I have had considerable loss with abortion with cows. Have not been able to save one calf as yet. There are two to calve Have only seven cows and five aborted about one month before their time. Cows are of all ages.

Now, the man who has sweet clover growing in his alfalfa, need have no fear, as the sweet clover will soon disappear if it does not seed. That has been my experience. Can alfalfa and clover be successfully siloed just as it comes from the field without chopping? Will a root cellar answer this purpose? J. M.

Rich, Idaho.

ANSWER.

See abortion, this issue.

Alfalfa and clover can be siloed without trouble if well packed and not too young. Clover should be siloed when the blossoms are beginning to turn. It is very doubtful if a root cellar will serve as a silo unless the walls are cemented and made smooth and air tight.

ARMOUR'S BLOOD MEAL Cures Scours in Calves.

First proved by the Kansas Agricultural Experiment Station, and since corroborated by thousands of leading stockmen who have used it without a single failure. Equally effective for the diarrhea of all animals.

PREVENTS weak bones, paralysis of the hind legs and "thumps" in pigs; "big head" of foals; "rickets" of all young animals; abortion due to incomplete nutrition, and a host of other troubles.

Stalled on the First Patron.

Ed. Hoard's Dairyman:—Having read in the Dairyman a number of the results of investigations among dairymen in different localities to ascertain the cost of milk compared to the cost of feed, I started out on a little investigation of my own in a cheese factory district and got stalled with the first patron. Said patron was about an average farmer in his community, and when he was satisfied I was neither an assessor nor census enumerator, he seemed willing to answer my questions truthfully. His farm consisted of 70 acres tillable land and meadow, and 80 acres of rough, hilly pasture that produces a variety of grasses. When I stopped at his place, his herd, which consists of 16 cows and 8 head of young cattle, were picking at some dry corn stalks thrown out on the leeward side of a nine wire fence. Although not a very cold day, the air was chilly and the cattle looked rough and uncomfortable. They were breedy looking grade Ayrshires, somewhat thin in flesh. Mr. Patron was working in the stable, which was none too warm, but perhaps warm enough, for cattle stand out most of the day in this northern winter and for that kind of treatment I think he bred wisely when he bred the Ayrshires. Mr. Patron knew nothing about the amount of revenue from his dairy. He milked from 16 to 20 cows during the summer, made very little, if any winter milk. His factory dividend from April to November was anywhere from $30 to $90 per month —when less than $30 per month, he kept it home and made butter. as he would not drive to the factory for less than a dollar a day.

Occasionally he sold milk to a peddler, but kept no account of it. Raised a few calves every year and kept a few pigs, but kept no account of the cost. "If I get a poor milker, or an unsound cow, I sell her, and sometimes if I get overstocked, I sell the pick of the dairy if the buyer pays me enough, and they hardly ever pick the best ones. I seldom feed the cows grain except as they may freshen early in the spring, then I feed them a little grain until they go out to grass. I figure to have them give milk while the grass grows, and a fairly dry season is better for my pasture than a wet one." As we entered the house we struck an atmosphere of tidiness and economy in every department.

"Last year," said he, "I had a good potato crop and got a good price for them and expended about $400 in repairs on the house."

"No," said he, "I never keep any account of expenses. If I did I guess there would be times when I would quit farming, but the business is a little better now. We make a living and pay our expenses and, I guess, make a little money every year, and when I drive in town occasionally I take a little whisky."

When asked what the Mrs. Patron did for recreation as an offset to his whisky indulgence, "Well," said he, "the madam is quite a home bird. Don't care to go out much, although she did spend two weeks on a visit to the city last October, and the getting ready and car fare and one thing or other took the price of a spotted cow. But that don't matter. The first words she said as she crossed the door sill was: 'I am awful glad to get home.'"

If the editor or business manager of your much esteemed paper can see any nucleus from which to radiate a balance between the cost of production and the receipts from this man's dairy, I yield the palm.

Certainly, he may attribute mostly his partial financial success to the frugality of his life partner. He seems fairly satisfied with about 60 per cent of what his farm and dairy might produce with a little better feed and care.

If the associate editor or any of the staff can make any suggestions that would cause this farmer, who reads no agricultural literature, to sharpen his pencil for a more strenuous action and figure out of the old rut, we will see to it that he gets a sample copy. Frank Sheldon.

Sandy Hill, N. Y.

HOLSTEIN COW, LADY CREAMELLE DeKOL, H. F. H. B., 47439.
Property of John B. Marcou, Princeton, Mass.

Creamery Patrons' Investigation at a Maine Co-operative Creamery.

Ed. Hoard's Dairyman:—Following is the continuation of my report:

No. 62—Thinks his cows are improving by purchasing to maintain the herd. He may be right, depending perhaps on how far back he dates his new system. There was a time, he will remember, when some of the old red cattle of Maine, (See a Report of the Maine Board of Agriculture), were on his farm. Those cattle were of the class championed by Prof. Curtis of Iowa. They were hard to beat as milkers, butter and cheese makers and for working oxen. In connection with purchasing cows, an old English veterinarian has recorded an experience of 20 or 30 years of the canny Scots of Ayr in this line. Readers may understand that, viewed from its influence on the Ayrshire breed in Ayr, it was not regarded as at all successful, and the Scots are careful buyers.

No. 63—Farm consists of tillage, 30; pasture, 30; woodland, 40 acres. There is a small orchard of about 40 trees; corn, potatoes, grain and hay constitute the principal crops; pasture is permanent; herd consists of seven cows. old and young, 2 oxen and 2 two-year-olds; the breed is Jersey, but none are registered; milking period is 10 months; no record or tests of milk are made; intend to build a silo soon.

On full feed cows are fed 4 pounds of corn and cob meal and cotton seed meal; prices are, for corn meal, $1.40 per cwt, and cotton seed meal, $1.50 per bag; cost of feeding varies with prices of foods; when hay is $10 per ton, the cost is about $40 per year; no account is kept of income from cream.

No grain is fed on pasture; cows are turned to pasture early and run out days until late in the fall, but they are housed every night in the year. Cows are soiled every year after the pasture begins to fail; herd is maintained by raising calves; cows are also raised to sell; try to improve the herd by using the best bulls means at hand will afford; calculations are made to balance rations; skim milk is fed sweet to calves and sour to pigs; Chester White pigs are bred for sale, and about 1,000 pounds of pork is fattened each year.

No. 64—Farm consists of tillage, 40; pasture, 70; woodland, 10; waste land, 10 acres; four acres are in an orchard containing 200 trees; principal crops are hay, oats, corn and potatoes; the rotation is hoed crops, grain and hay; pasture is permanent; the Jersey herd consists of cows, 6, and 5 other animals; the milking period is 10 months; queries as to records are unanswered, but there is no silo on this farm; on full feed cows receive 5 pounds of bran and cotton seed meal; prices are $24 and $32 per ton.

No estimate of cost of feeding or income per cow is given; pasture season ranges from May 10th to Nov. 15th; mowing fields are not grazed; the soiling system has not been tried; herd is kept up by raising calves from the best cows and using thoroughbred bulls when possible. In answer to query as to calculations to balance rations, this patron says: "I endeavor to make the grain ration highly nitrogenous, but do not fully balance it." Here is a close approach to scientific feeding, if the proportions of bran and cotton seed meal are varied with the kind of coarse feed, as we may suppose is the case from the reply. Hence when the oat straw is being fed, the grain may be three of cotton seed meal and two of bran; reversed to 3 bran and 2 cotton seed meal with good hay and when clover hay is fed *ad libitum*, there might be a substitution of 2 of corn meal for 2 cotton seed meal in the first.

A variation of the coarse food, making it three-fourths straw and one-fourth clover hay would also be a close approximation, and if the straw holds out, it could be used in the clover hay ration instead of corn, which might be exchanged for cotton seed meal, or fed to fattening stock. This patron is silent as to use and value of skim milk, but he raises calves, and that tells where much of the milk goes.

No. 65—Farm consists of tillage 35, pasture 15, woodland 2 acres; orchard consists of 9 trees; principal crops are hay and oats; pasture is permanent; herd consists of milking cows and heifers 11, young heifers 5; all are Jersey but none are registered; the average length of milking period is 10 months; no records of weight of milk are made but tests of quality are made; this patron has no silo.

On full feed cows receive 1½ pounds of cottonseed meal and 3 pounds wheat bran per day; prices in January 1903 were $1.60 and $1.10 per cwt. respectively; the income per year from cream, per cow, is $40.44, but the cost of food, per cow, has been omitted; cows are fed on pasture, 1 quart each cottonseed meal and wheat bran per head; May 20th to Nov. is the pasture season; has not tried soiling cows; raises calves to maintain herd which is improving by using good sires; calculations are made to balance rations; skim milk is fed to pigs and calves; usually winter 6 Chester Whites and raises 20 to 25 pigs per year.

Patron No. 65 evidently understands that two-thirds of a cow's capacity for food goes to her support and he feeds to get as near the other third as he can for production. If he tries March and September litters he might double his number of pigs from 3 to 4 sows. Unsold fall pigs will be thrifty shotes of a handy market size in early spring while all unsold March pigs will be heavy enough for profitable porkers by Thanksgiving. We suggest this change might raise many more net dollars from the same food if tried fairly.

No. 66. Farm consists of tillage, 20; pasture, 30; woodland, 10 acres. The orchard consists of 60 trees not yet in bearing; principal crops are hay and grain; no regular rotation is practiced; pasture is permanent. Five grade Jersey cows constitute the herd; no other cattle are kept. The milking period is "about 40 weeks" or 9½ months; no records are kept; milk has been set in glass tubes to judge of its quality. This patron has no silo; full feed to cows consists of 3 quarts each, twice per day, of corn and oat meal and half a pint of cotton seed meal, (a quart of cottonseed meal is approximately 1½ lbs., a half pint is therefore 6 ounces, or three-fourth pound per day—F. E. E.) corn costs 75 cents per bushel, cottonseed meal, $1.60 per cwt., oats are raised on the farm.

Estimate of yearly cost to feed a cow, $35; estimated income from cream $6.25 to $6.75 per month for five months; then less; this averages $6.50 for five months and $3.25 for 4½ months which equals $47.12 per year.

Cows are fed on pasture, two quarts of corn and oat meal per day, or per feed; cows are on pasture as soon as feed is good and run till cold weather. Mowing fields are not grazed and fodder corn is used when needed. Some likely calves are purchased and raised to keep up the herd; herd is headed by thoroughbred bull, and an effort is being thus made to improve it. By watching results in milk pail, rations are changed to balance up the yields; considers the value of skim milk to vary with the breed of animals fed. Fattens 4 or 5 cross-bred Chester Berkshire's each year.

No. 67—Farm consists of tillage, 40; pasture, 100; woodland, 40 acres. This farm has no orchard; the crops are hay, corn and grain; pasture has been alternated with crops in the past; herd of grade Ayrshires consists of 7 cows and heifers giving milk, 4 oxen, 1 bull, and 6 young animals with 3 horses. No stock is registered; milking period is 10 months; no records of yield and the only test is as can be judged by quantitity of milk as

milked; full feed to cows consists of 2 lbs. bran, 2 lbs. corn meal, 3 lbs. gluten meal; prices are $1.10, $1.40 and $1.40 per cwt.

Estimated cost to keep a cow a year is as follows:

400 lbs. corn meal	$ 5.60
600 lbs. bran	6.60
600 lbs. gluten meal	8.40
2½ tons hay	20.00
5 months pasture	5.00
Total	$45.60

Feed cows on pasture according to conditions; they are on pasture from 10th or 20th of May into October; sometimes graze mowing fields; soiling is employed to help out the pasture; nearly all cows are raised but sometimes one is purchased; try to improve the herd by using good bulls; estimates skimmed milk to be worth 25 cents per hundred pounds to feed calves and pigs; feed only 2 pigs a year.

No 67—Is a new man in his present location and has been on his farm only since late in last July. He has had a silo and an orchard and says, "These will come here later." He hopes to raise more grain and clover and thus save expense in purchased grain. A newcomer with progressive ideas is a help to his town.

No. 68—Farm consists of tillage, 30; pasture, 35; woodland, 13 acres; orchard of 25 trees covers half an acre; principal crops are corn, oats and potatoes; pasture is permanent; herd consists of 6 Jersey cows and 4 other cattle; milking period is 10 months; no records are kept; no tests made, and there is no silo on this farm.

Full feed to cows consists of 4 quarts wheat bran, 1 quart each cotton seed and corn meals; prices are $1.10, $1.60 and $1.35 per cwt; estimated cost of feeding, $35 and income $40 per cow; pasture season, May 15 to 20th until cold weather; fields are not grazed; herd is improving by breeding; rations are balanced; skim milk is valued at 15 to 20 cents per cwt. for feeding while sweet; feed annually 12 to 20 Chester White pigs.

No. 69—Farm consists of tillage, 40; pasture 25; woodland, 50; and waste land 35 acres; there is no orchard; principal crops are sweet corn, oats, beans, potatoes and buckwheat; the Jersey herd consists of 6 to 8 cows and 3 to 5 other cattle; none are registered; average milking period is 10 months; no record of yields are kept, but some tests of milk are made; there is no silo on this farm; shorts and middlings are fed; cost is $1.15 to $1.35 per bag.

Cost of feed and income from cream per cow per year is placed at $25 and $40 respectively; cows are pastured May 15 to Oct. 15 and no grain is fed on pasture; fields are seldom grazed; no trial has been made of soiling, but herd is maintained by raising calves; herd is apparently improving by use of thoroughbred Durham sires; rations are not balanced by calculation; use skim milk to raise calves and about 4 Chester White pigs a year.

No. 70—Farm consists of tillage, 50; pasture, 30; woodland, 20 acres; orchard consists of 50 trees on two acres, principal crops are hay and grain; no regular rotation; pasture is permanent; herd consists of 8 to 12 Durham and Jersey cows, of which none are registered; milk period is 10 months; no records of yields are kept, but some tests of quality of milk are made; there is no silo on this farm.

Grain feeds used are bran, corn and cob-meal and cottonseed meal; no amounts are given for full feed; bran costs $1.15 and cotton seed meal $1.50 per cwt.; estimated cost of feeding and income, per year, per cow, are $35 and $40 to $45 respectively; cows are on pasture from May 15th to sometime in October, and receive no grain during that period; fields are not grazed; cows are soiled late in fall; herd is maintained mostly by purchase; herd is improving "by buying the best that can be found;" rations are balanced by calculation; skim milk is fed fresh to Chester White pigs, of which 35 to 40 are fed yearly.

No. 71—Farm consists of tillage, 55; pasture, 75; woodland, 70 acres; the orchard contains 225 trees; principal crops are corn, potatoes, grain, hay; rotation is corn and potatoes first year; grain or Hungarian, second year; clover, third year. This patron does not state how long the land lies in grass; pasture is permanent; the herd consists of 12 to 15 cows, and 12 others, all grade Jersey; the milking period averages 10 months; no records of yields are kept, but some tests have been made; this patron admits the ownership of a silo.

On full feed each cow receives 3 quarts of shorts and cotton seed meal per day; prices are respectively $1.45 and $1.15 per cwt. The estimate of yearly cost to feed and income from cream per cow is $30 and $40. These cows are not mature, as half are heifers; cows are never given full feed of meal on pasture; cows go to pasture middle of May and run into November; fields are grazed with sheep only; have never tried soiling; herd is kept up by raising calves, and is "slowly improving." In regard to balancing rations this patron says: "I believe in feeding quite a per cent of protein;" feeds skim milk to calves and pigs, for which use it is valued at 25 to 30 cents per cwt.; improved Chester Whites are bred and about eight are handled each year.

FNANK E. EMERY.

Concerning Dehorning.

ED. HOARD'S DAIRYMAN:—In your issue of 27th Feb, Wm. H. B. of Concordia, Mo., advocates dehorning. In support of his idea he gives instances of injury inflicted by cattle wearing horns. At the Dublin dairy we now have 150 milch cows and none of them wear horns. Furthermore, no more cattle will be used on the place until they have been dehorned. Within a year we lost two fine cows and have had some abortions as the result of permitting the cattle to wear horns. The number of cattle which have been bruised, jammed, horned and otherwise injured, is considerable. We consider it a barbarous practice to use cows with horns.

One vicious cow will inflict more pain in a day than will be inflicted by dehorning a whole herd. In dehorning more than 250 cattle, we had not a single bad result. The horns will not grow on our calves—the buttons are taken off. When men become more nearly civilized, they will not arm poor dumb brutes with weapons for inflicting pain and injury upon themselves. Then too, the men who handle the cattle are entitled to some consideration. Each man needs two eyes, but if cows have horns, he is liable at any time to lose an eye, or to suffer other injury. Dehorned cattle are gentler, do not fight, are more easily handled, keep in better condition and give more milk and butter.

One bull who was becoming vicious, became quite docile when his horns fell off. It certainly does improve a bull's temper to take away his weapons. Some Jersey men object to dehorning, as the score cards allow several points for the horns. We concluded that the points of the horns was what we principally objected to, though we object to the entire horn. We use Jerseys and Jersey grades principally. We get 30 cents for our butter fat and the skim milk we find a sale for, also at a good price. By June we shall have 125 cows giving milk. We shall run our herd up to 200 or more cows later on. It is my plan to do all I can to develop the dairy interests of my section. Have sent you some subscribers for which I asked no premiums. I think your paper ought to be in the hands of all the dairymen and of cow keepers.

Stephenville, Tex. L. Y.

WE have received from the Elgin Dairy Report, a copy of "Weekly Prices" for 1902. This little book contains much that is valuable in the nature of dairy statistics, including the weekly prices of butter on the Elgin and other boards of trade for the last 22 years, and other material packed in a small compass; the price is 25 cents.

March
April May

There is a best time for doing everything—that is, a time when a thing can be done to the best advantage, most easily and most effectively. Now is the best time for purifying your blood. Why? Because your system is now trying to purify it—you know this by the pimples and other eruptions that have come on your face and body.

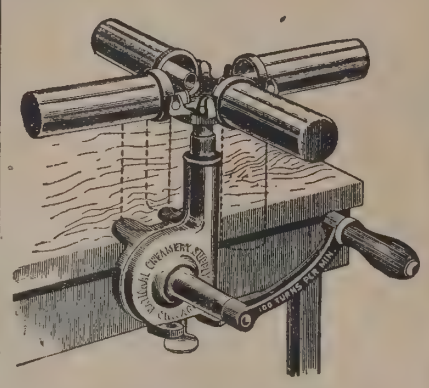
Hood's Sarsaparilla and Pills

Are the medicines to take—they do the work thoroughly and agreeably.

Accept no substitute.

Truth to Tell

There are no other milk cans made that can equal in wearing qualities the genuine



BUHL CANS

They are tinned to stay tinned, and put together to stand years of hard service. Other cans crack easily, become dented, and being lightly tinned soon rust and go to pieces. Not so with the "Buhl Factory," "Improved Elgin" and "Genuine Iowa." They will outlast any other cans on the market, and are thoroughly and quickly cleaned. **Remember,** the Buhl is the only can in the world that is made with the **Buhl "Victor" Can Breast** and the **Buhl "Victor" Round Handle.** As there are many inferior imitations of this can, we stamp all ours with the **Milk Can Trade Mark.** Look for it. Sold by all live dealers. Ask about them, or write us direct.

BUHL STAMPING COMPANY,
212 W. Larned St., Detroit, Michigan.

NATIONAL
Babcock Milk Tester

Dotted Lines show position of bottle holders when not in motion.

Has enclosed cut gears.
Swinging bottle-holders.
Runs without jar.
As well made as a cream separator.
Best tester for dairymen ever made.

The weight of machine when boxed, approximately 11 lbs.

DOES YOUR DAIRY PAY?

It costs no more to feed a profitab than an unprofitable cow.

NET PRICES:

No. 1,—2 bottle, complete for testing milk.... each ..	$4 00
No. 2,—4 bottle, complete for testing milk.... each	5 00
No. 3,—2 bottle, complete for testing cream and milk, each	4 50
No. 4,—4 bottle, complete for testing cream and milk, each	5 50

Prices include full directions for making test, bottle of acid, test bottle brush, acid measure, pipette and test bottles.

SAVE YOUR KITCHEN GREASE

Easy and quick is soap-making with

BANNER LYE

With one can—10 cents—you can make ten pounds of pure hard soap or twenty gallons of soft soap in ten minutes.

No boiling, no large kettles required.

Dissolve a can of **Banner Lye** in 3½ pints of cold water. Melt 5½ pints of clean grease. When cool, pour the **Banner Lye** water into the grease, and stir for a few minutes.

This will make better soap than you can buy. Send for our free book,

"Uses of Banner Lye"

It is full of information of interest and value to farmers dairymen and house keepers.

Any storekeeper can sell you BANNER LYE. If he hasn't it, he can get it quickly of his wholesaler.

THE PENN CHEMICAL WORKS, PHILADELPHIA, U. S. A.

This is the
Pioneer Parchment Paper Man.

It is an enlarged reproduction from the figure in the center of our trade mark. We make it this size so that you may take in all the lines and remember the figure. It stands for the highest quality of parchment paper on earth. When you buy anything of this kind you should insist that the "Parchment Paper Man" trade mark is on it. It is a positive guaranty of quality.

Pioneer Brand
Parchment Paper

is more largely used than all others by the dairymen and creamerymen of the country. This is so because after trial they have found it the best. They have found that it protects their butter and hence their reputation. It keeps out entirely all destructive germs and vile taints and odors and preserves the sweetness and flavor perfectly. We print your name, cut of dairy or creamery, trade mark or private brand upon each sheet. Send for sample sheets of the paper and booklets. **Be sure to ask specially for our booklet, "Better Butter."** We mail all these free. Address

WHITEMAN'S MILK BOTTLE FILLER fills 8 bottles at a time. The cost is $40.00. Will allow you $2.00 for freight.
A. V. WHITEMAN, 144 Chambers St. N. Y. City. Milk Bottles and Supplies.

Theory of the Lactometer.

ED. HOARD'S DAIRYMAN:—Will you please give an explanation of the principle of the lactometer, how used and whether it is accurate in detecting water in milk and approximate cost of instrument. J. H.

San Felipe, Calif.

This instrument is a form of hydrometer for determining the specific gravity of milk. The ordinary, or board of health lactometer, is graduated from 0 to 120. When immersed in distilled water at a temperature of sixty degrees F. it sinks to the 0 mark. When immersed in milk whose specific gravity is 1.029 at a temperature of sixty degrees F. it sinks to the 100 mark. Such milk is considered pure, as it has been found that milk seldom, if ever, is poor enough in solids to have a lighter specific gravity than 1.029.

This graduation from 100 to the 0 mark is equally divided, and is made for the purpose of testing milk whose specific gravity is less than 1.029. When this condition is found, it almost always follows that the sample tested has been diluted with water or some other fluid.

The graduation from 100 to 120 is made for the purpose of testing milk whose specific gravity is *greater* than 1.029. Most milk has a specific gravity *higher* than 1.029, and in some cases it has been found as high as 1.035, the average being 1.032.

The Quevenne lactometer is graduated from 15 to 45. When immersed in milk at a temperature of 60°F., whose specific gravity is 1.029, it sinks to the 29 mark. The graduation to 15 is for testing milk whose specific gravity is *less* than 1.029. The graduation from 29 to 45 is for testing milk whose specific gravity is *greater* than 1.029.

Thus it will be seen that 100 on the ordinary and 29 on the Quevenne are coincident. If the Quevenne is used the specific gravity can be determined by prefixing 1 and a "0". If the Quenvenne reading is 30, we would write 1.030, which would be the correct specific gravity. It is not necessary to bring the milk to a temperature of 60°, as a correction can be made by adding one degree to the ordinary lactometer reading to every three degrees of temperature *above* 60, and by subtracting one from lactometer reading for every three degrees of temperature below 60.

This corrects the reading from 50 to 70° of temperature, but, if milk is *colder* than 50° it were better to warm it to 50°. If *warmer* than 70° it were better to cool it to 70°.

This may be satisfactorily determined by the operator by making a careful test at 70°, correcting it as explained above, then cooling to 60° and comparing results. If the Quevenne lactometer is used, the correction is made by adding one-tenth to every one degree of temperature *above* 60°, and subtracting one-tenth for every one degree *below* 60°.

There are instances where milk can have a specific gravity of less than 1.029, and be pure and unadulterated. This is milk exceedingly rich in fat. If the fat has passed the point where the albuminoids refuse to follow, and, if having a specific gravity of 94-100, which is lighter than water, the ordinary lactometer will sink below the 60° mark, and the Quevenne will sink below the 29 mark. For this reason, where any doubt exists as to the purity of the milk, a sample should be tested by the Babcock test, and the per cent of fat ascertained.

The specific gravity alone, as shown by the lactometer, is merely an indication of the quality of the milk and cannot be considered as accurate unless the Babcock test is used with it to prove adulteration or skimming, but it will pick out the suspicious samples which can then be tested for fat and its actual condition thus shown. They cost from 75 cents to $2.00, according to quality and make.

Some Arkansas Figures.

What Kind of Aerator.

ED. HOARD'S DAIRYMAN:—What kind of aerator is the best for use in a dairy of from forty to fifty cows? I was impressed that the "Circular Cooler" might be good, though my means of knowledge in that direction has been limited.

I am interested in dairying and furnish hotel trade in Eureka Springs. One hotel "The Crescent," owned by the Frisco R. R., uses daily, in the height of the season, from eighty to one hundred gallons. I sell, delivered on platform station a few rods from my house, at sixteen cents per gallon and the milk is taken to the city on the train, a distance of two and one-half miles.

I keep two distinct breeds, Jersey and Red Polled Durham. Of the two I find the Jersey more profitable. I feed daily 12 lbs. of bran, 2 lbs. of corn meal and a reasonable amount of alfalfa.

After reading the various reports in your paper as to yield of milk, I am quite well satisfied with my last year's production. The average per cow was $11.08 per month, or $110.80 for ten months. I use the DeLaval Separator (Baby No. 2). The price of skim milk is ten cents per gallon, and cream $1.00 (4 gals. in one). The above yield was for milk at sixteen cents per gallon, and the price of bran ranges from fifty cents to seventy-five cents per hundred. It is worth seventy cents at the present time. Butter at twenty-five cents per pound is only about eight and one-third cents per gallon for milk, so I sell the milk.

This country is better adapted to fruit raising than to dairying. My 4,000 Elberta (mostly) peach trees of three years growth produced over 2,000 bushels of peaches last year, many weighing as high as 18 and 20 ounces. My pear trees of two years growth produced pears weighing twenty ounces.

Between the two extremes of North and South, Carroll Co., Ark., with its pure spring water and genial climate, is a most desirable place to live. B. A. D.

Eureka Spring, Ark.

Aerating milk is not so much insisted upon now as formerly. If practiced at all, it should be only under the most sanitary conditions, entirely removed from all possibility of contamination from odors or dust. There have been several articles in the DAIRYMAN recently on this subject. There is possibly a best aerator, but if so we have to confess our inability to point it out. Consult the advertisements in the DAIRYMAN, write to the advertisers for descriptions of their apparatus and its method of working and then get that one which appeals most forcibly to your judgment.

Wooden Hoops for Silos.

A. T. S., of Palmer, Ind., makes inquiry on this subject and is respectfully referred to answers given to other inquiries on the same matter.

"ADVERTISEMENT"

FOOLED THE HOSPITAL.

Was Pronounced Incurable But Got Well on Pure Food.

Sometimes in a case of disease resulting from the use of improper food the symptoms are so complex that medical science cannot find the seat of trouble, and even the most careful hospital treatment fails to benefit. A gentleman of Lee, Mass. says: "On April 1st, 1900, I was sent home by one of our Massachusetts hospitals, saying nothing more could be done for me. I have been a great sufferer from nervous diseases and rheumatism and nervous prostration and had previously been treated at Sharon Springs and by a number of doctors without getting much assistance.

One day I was felling worse than usual when I read an article about your Grape-Nuts that impressed me so that I sent out for a package. I commenced using it at breakfast the next day.

For fifteen months I never missed one day. If you ever saw anyone grow strong and improve it was I. I gained from 125 pounds to my old weight 165. I will always be a cripple from rheumatism but otherwise I am so much improved that I now feel as well as any man in the country." Name furnished by Postum Co., Battle Creek, Mich.

There is a receipe book in each package of Grape-Nuts that will interest the housekeeper.

The Old Way

**The heavy old milk cans are covered with dust,
All piled up in grim array.
Their mission is ended—on the shelf let 'em rust,
We work in the EMPIRE WAY.**

The Cat is Watching.

Tabby, of course, does not understand why it is so. Perhaps she remembers the days when Molly thought it was a day's work to wash the cans and pans they kept the milk in. Molly knows though that it is the

Empire Cream Separator

that lessens the work and keeps all the profits of the dairy right at home. The sweet milk is left for feeding your stock. There is money in most separators, but the most money in an **Empire.** It is the simplest in construction, the lightest running, the easiest to clean—the most profitable in every way. We have a book that tells you why. Get it.

WILL IT PAY YOU TO TAKE HOARD'S DAIRYMAN?

W. H. Jenkins took a census in 1901 of 50 farmers who were patrons of the creamery in Montrose, Pa. Twenty-five of themread dairy papers; twenty-five did not. The twenty-five who did read dairy papers averaged $50.23 per cow for the year. The twenty-five who did not read averaged $32.95. Here is a difference of $17.28 per cow. Did it pay the twenty-five to read? Did it pay the other twenty-five not to read? That's not all. Those who did read averaged a profit over cost of food of $15.06 per cow. Those who did not read averaged a profit of 66 cents. Is not that dairy farmer standing greatly in his own ight who will not pay 2 cents a week for Hoard's Dairyman? These are hard facts worth thinking over.

THE HIRED MAN.

This is a perennial subject of complaint with some dairymen, and strange enough there are men who never say a word, who keep plenty of help, and somehow they get along nicely, never have trouble with their help, or rarely so, and they make money. As sly as we may keep it we believe there is a good deal in the farmer as well as in the hired man. Mr. E. Grimm, of Clayton Co., Iowa, writes a very readable article to *Wallace's Farmer* on this subject which he concludes as follows:

"Now, my advice to the dairy farmer is this: Stick to the dairy. Get a good, reliable hired man, even if you have to pay him a little more. Help him to milk your cows, or at least go with him often enough to teach him to treat the cows gently. Let him unhitch in time to get done with the milking and chores by the time your neighbor who does not milk, gets done with his. Do not treat dairying as a side issue, but as the main branch of farming, and you will have no more trouble with dairying than with any other line of farming."

We say now, as we have often said before, too many farmers try to get a full day's work out of the hired man and then expect him to turn in and help do the milking twice a day. Small wonder that he kicks.

The Special-Purpose Butter Cow.

She Will be Bred on the Dairy Farms; Not Purchased.

ED. HOARD'S DAIRYMAN:—Thirty years ago the greatest share of the beef out-put of this country, was reared on the Government lands of the far west—the public ranges. The stock used was of a lank, mongrel type, known as Texas cattle. They were active and hardy and were driven and fed after the manner of the annual migration of the wild buffalo, whose pastures they had usurped. They were not ideal beef animals, but they were numerous, prolific, hardy and could rustle for their sustenance. Nevertheless, though their proportion of choice meat to cheaper parts, put them at a disadvantage when they reached the market, their owners clung to them quite tenaciously for their prior advantages and looked askance at efforts to improve their types by crosses of the improved pure, beef, breeds. The fear was that, in improving them for the butcher's block, they would impair their adaptation to the climate and to the long drive over the ranges- the only way then available for reaching the remote shipping points. But experiment finally removed doubts, and the more readily, as conditions gradually changed and the drives grew shorter. The public ranges became largely converted into private ranches and the railroads and packing houses came to the cattle, enabling the latter to reach the distributing market on wheel instead of hoof. So bulls of the improved beef breeds were repeatedly used upon the Texan foundation until the whole type of the herds have been changed. Where would one look for the old fashioned Texan steer in these days, if he could possibly have use for such? The Texan type has disappeared and in its place are close imitations of the Shorthorn, the Hereford and the Polled Angus. And the reason of it is, that nobody could now afford to raise the old sort even if he possessed the stock as it was. Every herdsman was obliged to grade up his stock to the improved type, or go to the wall. The change has added millions beyond comprehension to the value of the annual beef production of the country. Yet the first steps toward effecting it were quite generally regarded with doubt. Its value is now so plain as to provoke the inelegant slang: "a man without eyes can see it with his mouth." This great work of transformation has drawn upon the pure-bred beef herds of the country and given them a profitable market for their bulls.

Not so evident to the casual observer, but more startling when brought to the comprehension of the economist, is a parallel phase awaiting a like change in the field of dairying. By the census statistics of 1900 (the latest I have at hand), the total number of dairy cows in the country was 18,112,707. These were all cows kept primarily for milk and were milked; not those for beef and veal raising whose calves ran with them. The milk product was 7,728,583,350 gallons. This milk was of course divided among many uses—part marketed in bulk or in condensed form, part made into cheese, and much the larger share made into butter. The total product of butter was 1,492,699,143 pounds. Of cheese only about one-fifth as many pounds were made as of butter. Calling the average price of the butter 17 cents per pound, the butter crop was worth the enormous sum of $253,758,854.31. If we divide the total number of gallons of milk by the whole number of cows, we find that the average cow gave approximately 421⅙ gallons or 3,370 pounds per year. If it takes 22 pounds of average milk to make a pound of butter (and it takes all of that) the cows would average 153 1-5 lbs. of butter per year; worth at 17 cents per lb., $26.05. Dividing the general butter product by the average product of each cow, would give us 9,743,467 as the number of cows devoted to making the butter—considerably more than half of the milking cows in the country.

If the country requires 9¾ millions of butter cows, and the present average cow with butter at 17 cents per pound only brings a gross income of $26.05 (in addition to the value of her skim-milk, calf and manure), it is evident that many cows are kept at a loss, and that the dairyman of today with the average cow, is even more critically in need of improved machinery (in cows) than was the beef cattlemen of the ranges, thirty years ago, with his average Texan cattle. That the average cow of the 9¾ millions kept for butter making, is not paying her way, is evident. Nor with butter dairying as the leading feature, can her case be mended by her as a general-purpose cow, because her failure in butter is a sacrifice that will more than wipe out any profit that there may be in finally feeding her into beef.

The beef of the country is now made with greatest profit by a specialist cow, and only a comparatively small and generally inferior share is made by any other cow. Milk for sale in bulk is, in small part, made with best economy by a specialist cow, but the mass of it is made with less profit by the mongrel cow. A very small share of the butter of the country is made, at greatest profit, by a specialist cow, but the great mass of it is made with less economy, by the mongrel cow. The mongrel cow, even in the rare instances in which she is fairly good at the three requirements is never the most economical worker at either, and is not "improved machinery" of the highest class. The consideration of by-products is of course one of the sources of modern manufacturing economy, where margins of profit are close, but by-products are never profitable to work out where they detract in the slightest degree from the most economical production of the staple which is the direct object of manufacture.

We have seen that are over nine millions of cows used in the United States for making butter (Major Henry E. Alvord, chief of the dairy division of the U. S. Bureau of Animal Industry, has just sent me a private estimate that there are ten millions), and it would be a very large estimate to say that a half million of them are high class, special-purpose butter cows. But in time a transformation will occur by grading up the mongrel stock with pure-bred bulls of the special butter-producing breeds, just as a parallel transformation has been accomplished by grading up Texas herds with bulls of the special beef breeds. The greatest profits in butter dairying will be made by those who first obtain the improved machinery in the shape of special-purpose butter cows. As the whole mass of cows used for butter production become gradually improved toward that standard, the increased output of butter will tend to lower the market price. Let any butter dairyman working with ordinary cows, ask himself what the effect upon his profits would be if each of his cows, from the same feed, gave fifty per cent more butter than they do. There are large numbers of cows in the country, so perfect in the proclivities of their physical organism for the conversion of food into butter, that from a given quantity of food they can and do render four times as much butter as the average cow used in this country for butter making. These cows represent a standard to be aimed at in grading up the mongrels. Such cows are not all

JERSEY COW, SULTANNA'S ROSETTE, A. J. C. C., 149740.

Dam of Flying Fox, Ravachol, Forfarshire, John Bull. Age 13 years.

JERSEY COW, BROOKHILL ROSE 2d, P. 3440, H. C.

A famous Island Jersey cow, dam of the great bulls Reminder, Golden Jolly, Ironomy, Brookhill Fox.

confined to the pure breeds. I believe I have seen high grade Jerseys that, in butter dairying, could, at a given food cost, render as many pounds of butter as any pure-bred cow.

Between the average cow in use for butter making and the best of the cows of the special butter breeds, there is a wide gap to be closed, and depending upon how fast he is able to close it, lies the main profit of each dairyman. If, as a first step, he can change his ordinary cows and replace them with an equal number of already improved stock, without paying too big a difference, that is by far his best way, his quickest way and his surest way of shifting from the down-grade to the up-grade. But manifestly this door is open only to the very few. There is not enough of such improved stock in existence to go around. There is an easier, though a slower and not as immediately sure, way, but it involves less ready money, and is the one by which the great general transformation is gradually to be effected and maintained. Each dairyman must raise his own heifer calves and with them supplant his present cows. To do this, he must either own or have access to a pure-bred bull of an established breed of butter cows.

And so much depends upon the quality of that bull! Right there is a most critical point. A man selecting forty cows to pay his cash for and start a dairy with, would clearly see the importance of carefully investigating the dairy quality of each cow to see if he was getting money-worth. But too many men would skimp on their bull and fail to bestow on his selection the same careful investigation of his dairy quality (for dairy quality is innate, though latent, in the bull) that he would give to the selection of a single cow. Yet if he is to raise his heifer calves and use them in the dairy, there is as much of his future success at steak in the dairy quality of that bull as in his whole forty cows, and even more if he raises more than one heifer apiece from them.

To me it seems evident that the two breeds, most available for grading up the butter quality of the promiscuous stock, are the Jersey and Guernsey. These breeds are so near akin that their inter-crossed animals seem to breed true, but for some reason the Jersey type is more firmly fixed and is transmitted with more uniformity. But, dear me! there are Jersey bulls and Guernsey bulls and bulls of every pure breed too, that would be fearfully disappointing to the dairymen who used them for grading up butter-dairy herds. Every pure breed of milking stock, without exception, has a share of culls among its fine animals and it seems to me that a cull of pure breed is the worst kind of a cull. Unfortunately there are as many culls of the male sex as of the female, and the males do far the greatest damage. As nobody else will have the degenerate cow the butcher reluctantly has to take her, but the degenerate bull is liable to get shoved off among the farmers, to perpetuate his deficiences and detract from the prestige of the breed.

While I have spoken ot the Channel Island breeds as the most likely to prove the great lifters of the fortunes of the special-purpose butter cow, I do not claim, under all circumstances, that they would be immediately successful. Where a dairyman has already begun with an infusion of Holstein blood from the butter strains of that breed and is pleased with the results, let him stick to Holstein blood and not change to the Jersey or Guernsey in subsequent crosses. There is no "nick" between the Holstein and the Jersey. They are as oil and water to each other. It is a stand-off between them; each undoes the other and will continue to do so, until one in quantity has submerged the other. On the other hand Ayrshires and Jerseys usually mix with splendid results.

JERSEY BULL, GOLDEN FERN'S LAD, P. 2160, H. C.

A famous Jersey bull recently imported from England by F. S. PEER. Sire of Flying Fox and a great list of celebrities.

Now that I have warned against cull bulls let us turn to the good ones. I asked consideration of the effect of a fifty per cent increase in the butter yield of the average cow from a given unit of food. There are plenty of cases where twice that improvement has been effected with a single cross of a high-class Jersey bull on mongrel cows. It would not be difficult at all to find a Jersey bull which, crossed upon forty average cows, used in producing the butter crop of the country, would beget heifers that at maturity would average fifty per cent more butter from a given amount of food than their dams. Among such bulls of the past were Duke of Darlington, Ramapo, Pedro, Lord Dartmouth, (all sons of Eurotas), Stoke Pogis 3rd and Stoke Pogis 5th, King of St. Lambert, Imported St. Helier, Imported Tormentor, Signal, Imported Rioter 2d, Combination, Sir Harry, and the list might be extended indefinitely.

It may be said that bulls of that quality cannot be spared from thoroughbred herds to waste their quality upon common stock, and it is true that a special, high grade of bulls must always be retained for the benefit of the thoroughbred seed stock; but as between them and the culls (which should never be sold or given to the practical dairyman) there are classes of bulls that would do splendid work for dairymen who raise their own cows. Breeders of Jerseys, is it not your mission and your business, to effect among yourselves a system whereby a dairyman wanting a bull for grading purposes who appeals to your organization to aid him in his selection, shall get one highly typical of the best qualities of the breed and not get a cull instead? It can be done.

Again, communities of dairyman can keep on joint account, a small herd of exceedingly fine, high-class thoroughbreds from which their members can obtain bulls with an exact knowledge of the type of parentage from which they spring; or they can send committees to the great herds of the country and to the great auction sales to buy the bulls of such parents (shown on the spot) as met their approval in type. Bull calves of magnificent parentage may occasionally be had at these sales as low as $125, which in a year's time will come into use. Of course, most of the better ones will sell much higher, and some that would effect capital results, may go lower, but the point with the dairyman is to get *the best bull he is able to command.* If he can effect a forty per cent improvement in one cross it is much more profitable than to effect it in four crosses of ten per cent each. "The bull is half of his herd."

A ROW OF JERSEY WORKERS,

In the herd of CASE & WALKER, Rushville, Ind.

Let dairy associations send committees to the coming sales of Jerseys this spring to investigate the subject of bulls and the difference in their values. On April 15th, Frank C. Ward's importation, deep in Golden Lad's blood, will be sold near New York, headed by the young bull Golden Streamer, a magnificient son of his magnificent sire, (see picture of his dam) Forfarshire, and with him a splendid lot of young cows bred to him and worthy to produce bulls for the improvement of the stock of butter cows. On April 28th Case & Walker will close out their herd at Rushville, Indiana, headed by the great prize bull Carnation's Fern's Lad, with many of his get, from daughters of Golden Lad, Golden Fern's Lad, Financial King, The Owl, and other great sires, and backing up to such great butter families as those of Interest, Golden Glitter, Brookhill Rose 2d, Jersey Skater, etc.

It looks now as though Mr. Frank S. Peer will sell early in May an importation of Island-bred and England-bred Jersey cattle now at the U. S. Government Quarantine Station at Athenia, N. J., among which is the world-famous bull, Golden Fern's Lad, the average quality of whose get has been higher than that of any sire in the history of the Jersey breed, judging by their winnings in the prize rings and dairy tests, and the prices they have uniformly brought on the Island of Jersey, in England and in this country. He surpassed even his double grandsire, Golden Lad, in this respect. All of the best judges and most discriminating buyers take off their hats to "Fern." He got the highest priced animal in Mr. Cooper's importation of 1900, the heifer-in-milk Golden Sultana, at $1,600, and also at his sale of 1902, the bull Flying Fox, which brought $7,500—the highest auction price, anywhere, for a Jersey.

Fern also got the great prize bull, Imported Carnation's Fern's Lad, at the head of Case & Walker's "Jersey Isle" herd at Rushville, Ind. Fern has also several daughters in that herd, two of which are out of the famous Island Queen of cows, Brookhill Rose 2d, a granddaughter of Sultanne through the latter's son, Count Wolseley. Mr. Peer, when securing "Fern" from the Chestall Herd of J. Reid Walker, Rugeley, England, who had bought him some years ago on the Island, also got a wonderful collection of other stock therefrom, including eight of Fern's daughters and a good number of cows in calf by him. This herd, with exception of that of Lord Rothschild, is perhaps the most distinguished in England. A unique feature of Mr. Peer's selections from it is the young bull Brookhill Fox, by Flying Fox out of Brookhill Rose 2d, (both above mentioned) and a lot of heifers, some of them Fern's daughters, bred to him. Brookhill Rose 2d is the dam of the great Island bulls Reminder, Isonomy and Golden Jolly and a lot of Mr. Ward's imported heifers are bred to the latter, as is also true of a number of Mr. Cooper's present importation.

Brookhill Rose 2d as dam of great bulls, ranks among recent Island cows second only to Rosette 5th, the dam of Flying Fox, Ravachol, John Bull and Forfarshire, and it is a significant fact that both are granddaughters of that leading fountain of merit, old Sultanne P-7-H. C., and these two cows are the nearest female ancestors of Mr. Peer's young bull, Brookhill Fox.

Mr. T. S. Cooper's sale will occour at Linden Grove, Coopersburg, Pa., on May 30 and in it will be Rosette 5th's son, Forfarshire, the kingliest bull that ever crossed the water. His sons are sterling and his daughters are gems. Mr. Frank C. Ward who searched the Island thoroughly, places them ahead of all, and bought the young bull Golden Streamer by Forfarshire to breed his cows

[Continued on page 158]

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condense the questions into plain specific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

Feeding Brood Mares. Suckling Foals.

I have two mares that will bring colts soon, but will be located where but little pasture can be had. Can obtain shelled corn, corn chop, shorts, bran, oats and flaxseed meal. The oats are out of proportion in cost, but will feed it if necessary. Also prairie, timothy, clover and alfalfa hay. Please prescribe a balanced ration by weight. I want to work the team at light work if I keep them on this ration. J. T.

Tonganoxie, Kas.

The fact that many colts are foaled in the fall and their dams kept on dry feed through the winter, the colts meanwhile thriving, is conclusive proof that pasture is not particularly essential to success. Prescribing a formula for a ration in such cases, giving specific amounts of specific feeds, and this more especially where the dams are to be worked, is wholly impracticable. Make a mixture of corn chop, oats and bran, equal parts by weight,—and feed enough of this daily, in connection with 12 to 15 lbs. of hay, to keep the mares in good condition. Alfalfa hay has been tried for horses at the Utah Experiment Station with good results, but its effect upon brood mares in milk has not, to our knowledge, been reported on. Try it at first, therefore, in a moderate way, and be governed by results. If necessary, use enough flax-seed meal to keep the bowels in proper condition, and withal do not omit something more than a pinch of salt every day.

Back Numbers Wanted—When to Feed Grain.

I have Index to volume 33, but not the papers. How can I get the papers giving information about alfalfa?

Also please inform me which is the better plan to feed grain, before or after milking? E. C. M.

Lewiston, Ill.

We could furnish the issues indicated at the rate of two cents each.

Cows are so much creatures of habit that it is not advisable to change, whatever practice may have been followed. Our own plan is to feed all the cows immediately before commencing to milk.

A Vermont Ration.

Please give me a balanced ration from the following feeds: Cows fresh in milk, have plenty of hay, mostly timothy, some clover mixed in; bran, $23 per ton; cotton seed meal, $30; corn meal, $24; dried brewers grain, $28.50, licensed to contain not less than 33 per cent protein, 11 per cent fat. I have one ton of Buffalo gluten feed that I bought last summer, and the rest I shall have to buy. I have 29 cows now, but shall milk 40 this summer. M. A. C.

East Berkshire, Vt.

It is much to be regretted, of course, that cows are coming fresh in milk at this season of the year. Experience has proven over and over again that cows freshening in the fall will yield quite a liberal per cent more milk during the lactation period than when coming fresh in the spring, and in addition one has the benefit of the better prices secured for dairy products during the winter. Our advice to this inquirer, and to others similarly situated, is to breed his cows, at the earliest possible period, so as to have them freshen next time in the early winter and after that in the fall. Meantime, these cows should be carried forward to grass, encouraged to give all the milk they are capable of giving, and to that end we suggest that they be fed 20 lbs. hay, more or less as each cow's appetite may demand, and in connection with that as an average grain allowance, 2 lbs. of the gluten feed, 4 lbs. of the dried grains and 2 lbs. of ground corn,

Our opinion is that the dried grains are not a product from breweries, but from distilleries. Brewers dried grains contain on an average only about 15.7 per cent of digestible protein, or 20 to 25 per cent by chemical analysis.

A West Tennessee Silo.

I saw in your last issue what you had to say of silos in West Tennessee. The only one I have known of here was a failure. Please tell me what size silo it would take to hold feed to feed with other roughage, a hundred head of cattle five months, and what ought it to cost to have silo built, also, will you refer me to some reliable contractor as near me as possible, that would build and guarantee same? J. W. E.

Kenton, Tenn.

A round silo 21 feet in diameter and 32 feet deep would probably suffice, in connection with other roughage, to feed 100 head of cattle five months. We should, however, generally prefer to build two silos 16 feet in diameter and 30 feet deep, or 17 feet in diameter and 27 feet deep rather than one large silo.

We would not like to submit any estimate as to probable cost of a silo in the locality where this correspondent resides. There are advertisers in our columns who offer to build and ship silos and they will submit their own estimates. Or our friend can get the lumber and build a silo with help from the directions which have so often been published in the DAIRYMAN.

Salting Butter in the Churn

Can you give me the process of salting butter in the churn? I have tried it without success, putting in two ounces to the pound. We supply families, and must have a uniform article, and if we can salt the butter in the churn and not have to work it in the bowl, it will save us time and work. W. N. K.

Centreville, Pa.

Salting butter in the churn was a favorite method a few years since, but seems to have gone out, as we hear nothing about it now. If the churning is stopped when the butter is in fine granules, the salt sifted evenly over the mass, and the churn rocked to bring the butter into a mass, the butter will be evenly salted. This butter will requires working to remove the excess of water, and it is doubtful if the salting in the churn is any advantage or saving in work over the regular method of salting and working.

An Unaccountable Falling off in Yield of Milk.

Last winter we fed the following ration for cows numbering about 80: 15 lbs. alfalfa hay, 20 lbs. wheat straw, 3 lbs. bran, 2 lbs. ground wheat, 1 lb. corn meal, which amounts to protein, 2.40; C. H., 16.42; E. E., .43. This winter we are feeding the following ration to the same cows: 20 lbs. oat straw, 12 lbs. alfalfa hay, 1 lb. cotton seed meal, 6 lbs. bran, which amounts to protein, 2.59; C. H., 15.65; E. E., .61. Last winter we got about 1,500 lbs. per day. This winter we are running only 900 lbs.

The cows are handled in the same way and by the same men and freshened about the same time. These cows were shipped here from Iowa and Wisconsin; are Holstein and Durham grades. Were shipped a year ago last fall.

Shortly after they came here we had a siege of foot and mouth disease, but they soon recovered from this. I am at a loss to know the cause of this decrease. The cows are all or most all under 8 years old. Would be glad to know what you think about the matter. R. E. B.

Macon, Mo.

We do not think that the difference in the manner of feeding is sufficient to account for the falling off in the milk yield from 1,600 pounds per day to 900 pounds, or nearly 50 per cent.

We incline to the opinion that the cows were fed too heavily a year ago and got into the habit of laying on flesh, and that this year they are turning their feed more to flesh than to milk. If this guess on our part should correspond approximately with the facts we think it doubtful if these cows can ever be brought back to profitable milking, certainly not during the present period of lactation.

It is incredible, we think, that these cows should have had true foot and mouth disease last year and recover from it and do as well as they did. Foot and mouth disease is very contagious and would have run all through the neighborhood.

A Vermont Feeding Inquiry.

What is the best way to feed my stock? They are mostly grade Jerseys, some thoroughbreds. I have a good quantity of oats and ear corn and good hay. Can get bran or middlings at $24.00; oil meal, $35.00. I carry milk to creamery. Cows will be freshening now for two months. Three already freshened; sixteen cows in all. E. P. F.

Hortonville, Vt.

Good hay in connection with a mixture of oats and corn in equal parts by weight, makes a very satisfactory ration, but the chances are, we think, that it would be more expensive than a combination of bran and middlings at the prices named. With either combination, a small allowance of oil meal daily would be altogether in order, not so much for its nutritive properties as for its hygienic influence.

Does it Pay?

I am one of your two bit subscribers who are getting the worth of their money out of your paper. The creamery business is new here. I am milking 3 Jersey cows worth $60 each, that have been fresh three months. Feed alfalfa hay at $8 per ton and 10 quarts of loose bran to each cow daily, at $18 per ton. Get 21 lbs. of 4.4 milk daily from each cow, which sells for 29 cents for fat at creamery. Delivering milk costs 12 cents per 100 lbs. My cows are small and light feeders, pretty and gentle, four years old. Whenever I lessen feed, milk shrinks, and cows get more costive. Now, my neighbors say it won't pay to feed over three quarts of bran, at the price. What do you say, and how good are my cows? I do not know how much the ten quarts of bran weigh, nor how much hay they eat, so can't tell about the profits. Can you? L. B. Z.

Milton, Ore.

Every dairyman should have either a set of scales or spring balances that will weigh up to 30 pounds. Had this correspondent had the means of weighing his bran and his hay, and could have told us how much he was feeding, we would have been better informed and, therefore, better enabled to submit suggestions. It is probable that his 10 quarts of bran will weigh approximately 8 pounds, and presumably his cows are eating less

"ADVERTISEMENT."

Dr. Shoop's Rheumatic Cure

Costs Nothing If It Fails.

Any honest person who suffers from Rheumatism is welcome to this offer.

I am a specialist in Rheumatism, and have treated more cases than any other physician, I think. For 16 years I made 2000 experiments with different drugs, testing all known remedies while searching the world for something better. Nine years ago I found a costly chemical in Germany which, with my previous discoveries, gives me a certain cure.

I don't mean that it can turn bony joints into flesh again; but it can cure the disease at any stage, completely and forever I have done it fully 100,000 times.

I know this so well that I will furnish my remedy on trial. Simply write me a postal for my book on Rheumatism, and I will mail you an order on your druggist for six bottles Dr. Shoop's Rheumatic Cure. Take it for a month at my risk. If it succeeds, the cost is only $5.50. If it fails, I will pay the druggist myself—and your mere word shall decide it.

I mean that exactly. If you say the results are not what I claim, I don't expect a penny from you.

I have no samples. Any mere sample that can affect chronic Rheumatism must be drugged to the verge of danger. I use no such drugs, and it is folly to take them. You must get the disease out of the blood.

My remedy does that even in the most difficult, obstinate cases. It has cured the oldest cases that I ever met. And in all my experience—in all my 2000 tests—I never found another remedy that would cure one chronic case in ten.

Write me and I will send you the order. Try my remedy for a month, as it can't harm you any way. If it fails it is free.

Address Dr. Shoop, Box 934, Racine, Wis.

Mild cases, not chronic, are often cured by one or two bottles. At all druggists.

A GREAT COMBINATION!

GOOD COWS AND A U.S. SEPARATOR FILL THE FARMER'S POCKETS WITH MONEY!

The U. S. Separator gets all the cream from the milk,
The cream makes the butter,
The skim-milk makes the calf,
All bring in the cash.

STAR MILK COOLER CO., Haddonfield, N. J.

EASY.

It is easy to go on losing money by taking care of milk in the old way, that is, by not taking care of it: But it is easy, too, to take proper care of your milk with a

Champion Milk Cooler-Aerator

The Champion is pre-eminently the easy Cooler—easy to buy, easy to take care of, easy to use.

A Booklet for the asking.

Champion Milk Cooler Co., 67 Main Street, CORTLAND, N. Y.

than 20 lbs. of alfalfa hay per day. The expense for feed is, therefore, about 15 cents per day, per cow. Twenty-one pounds of 4.4 per cent milk contains .924 pounds of fat, of the value of 26.8 cents at 29 cents per pound. It costs 2½ cents to deliver the 21 pounds of milk, which deducted from the value of the fat will leave 24.3 cents income from 15 cents worth of feed, or at the rate of $1.60 for each dollar's worth of feed. We venture to say that his neighbors who feed only 3 quarts of bran, will not get as profitable returns.

To Build a Silo with Wooden Hoops.

I am very much interested in the wooden hoops for silo spoken of by John Gould and will some one kindly give plan for hooping by that method? We wish to put up a silo this year and if we can save from $25 to $40, it will mean considerable? Have thought of putting the corn in whole the first year. Do you think it would be wise and how should it be laid in to insure best keeping in a round silo?
Meridean, Miss. S. P. S.

Make a circle on the ground or a smooth platform, of the diameter of the proposed silo and drive stakes or set up blocks at intervals of 2 or 3 feet and bend the first layer of the hoop around this form, tacking it lightly to the stakes. After this put on the second, third and fourth layers, nailing them together firmly and breaking joints. Around each layer overlap the joint of the preceding layer 4 or 5 feet. Make enough of these wooden hoops so that they may be put in place about 2 feet apart at the bottom and the second and third spaces and afterward increase the distance gradually until at the top the hoops may be 4 feet apart. Put these hoops in place, being very careful to have them exactly plumb and firmly stay-lathed, and then ceil up the inside with narrow flooring.

We do not advise putting whole corn in the silo, and yet it is done to a greater or less extent with very considerable success. Great care must be taken, however, in packing the corn very close, not only around the edges but all through the silo. As it is very difficult to get the butts of the stalks just even, the usual practice is to double over the tops of the bundles near the outside and thus crowd them up close. If the corn is not cut with a harvester and bound in bundles, it should be gathered together in small bunches and treated in the same way.

Results from Feed not Satisfactory.

We milk 20 grade Jerseys and are shipping cream and do not think we are getting the best results of the feeds, as we are feeding. We are mixing 200 lbs. bran; 100 lbs. gluten meal; 100 lbs. oil meal, old process; 100 lbs. cotton seed meal and feeding good ensilage night and morning and stalks at noon and 8 qts of the above mixture in 2 feeds to the best milkers and 4 qts. to the rest. If you can make any improvements in feeds, kindly do so. J. F. & S.
Walworth, N. Y.

There would seem to be no reason why cows fed as above should not do well, provided they receive all the silage they will consume without waste, and the grain mixture weighs not less than a pound to the quart. If not now giving salt night and morning try mixing a teaspoonful with each feed, and give the grain with the silage, and not as a separate feed.

Should a Stave Silo be Anchored to Foundation.

In building a stave silo do the staves sit on the cement bottom with nothing to anchor them? If so is there not danger when silage is being packed that the staves will rise and let in air. J. C. L.
Louisville, Ga.

The staves are set directly on the foundation and are not anchored or fastened in any way thereto. The settling of the silage has no upward thrust and no tendency to lift the staves off the foundation. It is desirable, however, to put a little clay or cement around the bottom of the staves either inside or out, or both, to prevent the air from finding a passage under the staves.

Alfalfa Seed.

I find there are different kinds of alfalfa seed on the market, viz.: Turkestan and common. Is the Turkestan enough better to justify the extra expense in seeding 6 acres? Common is quoted at $12 per cwt. and Turkestan at $25. D. E. C.
Trempealeau, Wis.

A good quality of the common alfalfa seed is probaly all that is necessary for the man's crop, but it would not be unwise to try the Turkestan on one or two acres.

Siloing Clover.

I receive your paper weekly and wish you would send me ½ dozen sample papers, as I wish to get my neighbors to take same. Would you kindly tell me how to cut clover, and how to put it in a silo, or what plan would you take to fill a silo starting from the field? Can I fill a silo half with clover and balance with corn? To build a new barn and also a silo. I have 620 acres of lime stone loamy ground and am milking 18 head of cows and expect to milk twice as many when I can make more room. I live 2½ miles East of Cumberland, Md., and milk sells at .08 per qt. and 24 cts. per gallon. I also raise hogs, from 80 to 100 head. Where can I buy a silo all ready to put up? R. A. B. T.
Cumberland, Md.

See the communication from Mr. Baker on page 106, and one from E. R. W. page 137. There is no objection to filling a silo partly with clover and finishing with corn. See our advertising columns for manufacturers of silos.

Keeping Butter in Summer.

Can you tell me how I can prevent butter from spoiling duri g the hot summer months, when the plentifulness of it compels me to keep it for a month or two. I have a refrigerator and cellar?
Catawissa, Pa. H. S. G

Butter cannot be kept in the summer without some change in quality, but a good cold storage will prevent any serious change in flavor. Neither a cool cellar nor a common refrigerator is sufficient. A cold storage where the temperature can be kept below freezing is the only safe place for keeping butter.

A Discouraged Tenant Farmer.

ED. HOARD'S DAIRYMAN:—After reading the editorial sermon, "Making a Start", on page 6 Feb. 13, I have concluded that it was meant for those who owned farms of their own. It seems to me there is a wide gulf between the tenant farmer and the way you teach to conduct work on a dairy farm. I am working a farm on shares.

My landlord refuses to place any of those things on the farm, that you teach should be on a well conducted dairy farm: Namely a silo, replace the old fashioned stanchion with some more comfortable method of tying, drain underneath the floor, and put in tight gutters back of cows.

Now if you can tell me how that gulf can be bridged, I will be very thankful. It makes me discouraged to read the DAIRYMAN, and then to think I can not have things as other folks do, and as they should be. Sometimes I think I would rather work for someone for wages, that has things up to date, than to work a farm myself. If you can give me any encouragement, it will be gladly received.

I have grown beets for the cows about every year. But this year I am thinking of growing sugar beets for the factory at Menomonee, and having pulp shipped back for the cows, at a cost of 87 cents per ton. Do you think it will pay?
DISCOURAGED FARMER.
Waukau, Wis.

We can't blame you for being a bit discouraged with that blind, stupid, landlord, who don't know enough about good dairy farming to deserve such a tenant. But the way out for the present, in our opinion, is to change landlords There are hundreds of farmers who read the DAIRYMAN, who are up-to-date men, who will appreciate and encourage a live man, who wants to do his level best. Send us your full name and address, and we will refer all parties who want a good tenant, to you.

Put a small ad. in the special Notice Column of the DAIRYMAN saying: "Wanted—A live up to date landlord, who has a good dairy farm, with silo and good buildings to rent. Address ——— Care DAIRYMAN." Try it and see what will come of it.

Feeding Value of Bean Straw.

ED. HOARD'S DAIRYMAN:—On page 81, P. S. F., Castroville, Cal., asks for information with reference to the feeding value of bean straw, and as we are in one of the important bean producing sections I thought I might give my "mite" in return for the many helps which I have received from the columns of your paper. Bean straw, or bean fodder as it is called here, is highly prized as a feed for stock of all kinds and makes an excellent feed for milch cows when fed in connection with hay, straw or corn stover, but it is necessary to use a little care, not to overfeed when commencing its use, as it has a tendency to produce looseness of the bowels.

After the cows become accustomed to it, they may be fed what they will clean up at one feed a day. It is rich in fat forming elements evidently as the cows are always sleek and in good condition when fed on it, provided they have proper care in other respects.

I would like to hear through the DAIRYMAN from any one who has tried cow peas or soy beans in western New York and found them a success. J. N.
Wyoming Co, N. Y.

Paint Without Oil.

Remarkable Discovery That Cuts Down the Cost of Paint Seventy-Five Per Cent.

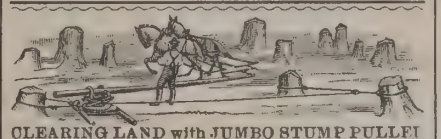
A Free Trial Package is Mailed to Everyone Who Writes.

A. L. Rice, a prominent manufacturer of Adams, N. Y., has discovered a process of making a new kind of paint without the use of oil. He calls it Powdrpaint. It comes to the farmer a dry powder and all that is required is cold water to make a paint weather proof, fire proof and as durable as oil paint. It adheres to any surface, wood, stone or brick, spreads and looks like oil paint and costs about one-fourth as much.

Write to Mr. A. L. Rice, manufacturer, 346 North St., Adams, N. Y., giving the name of the dealer from whom you buy your paints. Mr. Rice will send you a free trial package, also color card and full information showing you how you can save a good many dollars. Write to-day.

A Handsome Book

About Mandolins, Banjos and Guitars, Free.



Any one interested in the subject of mandolins banjos and guitars can obtain a beautiful book about them free by writing to Lyon & Healy, Chicago. It contains portraits of over 100 leading artists, together with frank expressions of their opinion of the new model Washburn Instruments. Descriptions and prices of all grades of Washburns are given, together with "Facts about the Mandon" and "How to Play the Mandolin."
LYON & HEALY,
100 Adams St., Chicago, Ill.
Washburns are sold by leading music dealers everywhere.

Creasey Ice Breakers

Dairymen and shippers of milk and cream find them most efficient, economical machines, and the greatest savers of time and ice. Easy to operate. Rapid cutters. The design is right. Made in sixteen sizes to suit every requirement. Send for catalogue "11-B" which gives full particulars.

The Distribution of Skim Milk.....

It is known that the just complaints of creamery patrons on account of unfair distribution of skim milk are the bane of the separator creamery business. Further disputes among patrons, annoyances to managers, hindrances to the best work of buttermakers, watering the skim milk, and many other ills in the same train are unnecessary, since the

Barber-Coleman Check Pump

has for more than five years been successfully solving the problem in many different creameries. When a patron has dropped in his check he can pump the amount of skim milk called for by his check, less the percentage taken out as cream, so in like proportion to all other checks. Its measuring apparatus is just an ordinary pump which everyone understands and knows how to operate.

FORT ATKINSON, WIS.

A DAY WITH A FINE JERSEY HERD.

It is one thing to be a broker and quite another to be a builder. So indeed it is quite a different thing in the way of instruction to spend a day or a week at a farm devoted to the development of Jersey cattle along true dairy lines, from what it would be to merely look over a herd at an auction sale. A few years ago, the senior editor of the DAIRYMAN had the pleasure of spending a day on the famous Jersey breeding farm of Mr. Frank W. Hart, of Cleveland, Ohio. We then recorded our convictions that Mr. Hart was an instinctive breeder, guided by cardinal principles, holding the work of his hands true to the final outcome—that of making the Jersey cow as large and profitable an expression of dairy capacity as it is possible to make her

It was with renewed interest therefore, that we responded to the invitation of Mr. Hart to make one of a party of about 40 Jersey breeders and dairymen to visit his farm March 13. The day was propitious and a run of an hour on the electric railway brought us to the famous Cherry Farm.

The recent enlargement of the barns and other changes in the general arrangement of the buildings makes a harmonious, commodious and instructive picture to start with. Practical thought and intelligent purpose stand out here. The day was spent in looking over some of the more notable cows and young things, but more especially in making of it a great object lesson in the study of prepotent breeding power. At the head of the herd stands that powerful Jersey exponent, King's King of St. Lambert, 12 years old and as active and alert as any of his sons. This bull has 25 daughters in the tested list, and nearly the same number that will go in the list in the near future.

It was worth going across the continent to read the lesson of what "blood can do" as cow after cow, some two-year-old heifers and others, old cows, all with splendid udders were led out, and at once surrounded with an eager group of men, all hard students of this problem of dairy breeding. The editor of the DAIRYMAN could not help calling their attention to the strong, rugged backs and the rise at the pelvic arch of old King and all his noted daughters and sons. Some day we hope dairy breeders will begin to study the significance of this great channel of nerve force, the back bone and its conformation, as well as what it means to the purposes involved.

Mr. Hart is doing some wonderful work in in-breeding. Two young bulls were shown with 100 per cent of the blood of King's King, and finer examples of constitution and personal vigor cannot be found.

The entire company partook of a bountiful collation tendered by the generous host and left Cherry Farm delighted with the instructive lessons in dairy cattle the day had brought them. The following are the names of the guests of the day:

Prof. C. S. Plumb, of Ohio State University, Columbus; Prof. J. W. Decker, Ohio State University, Columbus; Prof. C. F. Mabery, of Case School of Applied Science, Cleveland, Ohio, whose Windemere Jersey Farm is at North Gorham, Maine; Mr. H. K. Stewart, Washington C. H., Ohio; Mr. W. H. O. Goist, Girard, Ohio; Mr. Geo. E. Scott, Mt. Pleasant, Ohio; Mr. H. C. McCamon, Signal, Ohio; Mr. John Gould, Ohio; Dr. T. W. McDermott, Willoughby, Ohio; Mr. R. C, Miller, Cleveland, Ohio; Mr. J. E. Gray, Youngstown, Ohio; Mr. W. J. Pontius, Canton, Ohio; Mr. J. E. White, Greenfield, Ohio; Mr. C. P. Dickerman, Mallet Creek, Ohio; Mr. J. S. Devol, Marietta, Ohio; Col. A. T. Dempsey, Secretary of Ohio Jersey Cattle Club, Columbus, Ohio; Messrs. W. T. Williams, F. G. Robb and A. W. Eldred, North Olmstead, Ohio; Messrs. F. M. Wilson and T. L. Calvert, Selma, Ohio; Manager Geo. H. Wilson, of Pennsylvania Reform School Herd, Morganza, Pa.; Messrs. Woodworth & Son, Geneva, O.; Messrs. R. J. Hyde and W. O. Kindig, Medina, Ohio; Mr. H. H. James, proprietor Walnut Lake Jerseys, Detroit, Mich.; Mr. A. M. Carr, Mr. Chas. Brooks and Mr. A. C. Pidgeon, of Salem, Ohio; Mr. L. V. Axtell, the Guernsey breeder of Perry, Ohio; Manager Curtis and Herdsman Aukeman, of Old Orchard, Painesville, Ohio; Manager N. A. Bucklin, of Sugar Loaf Herd, Chillicothe, Ohio; Mr. Jenkins, son of D. H. Jenkins of the *Jersey Bulletin*; W. D. Hoard, of HOARD'S DAIRYMAN.

A rousing vote of thanks was tendered Mr. Hart for his kindly hospitality and the opportunity for rare information he had so generously afforded.

THE MANURE QUESTION.

On the question of whether it is best to haul the manure every day from the stable to the field, there is a great variety of opinion, and altogether too few facts are adduced. As is well known, the editors of the DAIRYMAN believe and practice the method of hauling each day as long as the cows are on winter keep. Here are some well demonstrated facts to bear on that practice: Prof. Voorhees of the New Jersey Experiment Station, found that where the solid and liquid manure was applied together, the yield was 3.38 times greater than when solid manure was applied alone. Now when the manure is drawn every day, the liquids go with it. When piled up to be drawn at some future time the liquids have leached out of it. So there is a gain of 3.38 times to start with. He also found that the fresh solid and liquid manure, combined, was more effective than fermented solid and liquid manure. The average yield of solid and liquid manure is 12¾ tons per cow of 1000 pounds weight per annum. This manure contains 117 lbs. nitrogen, 77 lbs. phosphoric acid and 89 lbs. potash. It has been found that when the manure is left in heaps for 109 days, it loses 37 per cent of its nitrogen, 51 per cent of its phosphoric acid and 47 per cent of its potash. It strikes us that this loss is much greater than the loss from washing which so many think they see. It is well to remember that the loss through fermentation and consequent evaporation where the manure is piled, cannot be readily seen. A little discoloration in the washing of manure is easily seen. To the farmer the latter may look ten times bigger than it really is, while the former is really ten times greater than can be seen. It required careful, chemical analysis by Prof. Voorhees to detect the loss by fermenting.

From this we judge there is the least loss in hauling the manure out when it is fresh and before any fermentation has set in. Besides all that, there is the economy of labor. We are hauling at a time of year when hired help is cheapest and there is the most leisure. In the spring and fall the conditions on the help questions are reversed.

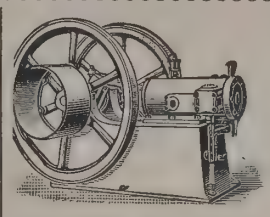
This is a lesson in Farm Economics.

Why Will Not Others Do Likewise.

Mr. P. P. Eddy, of Kandiyohi county writes us the following letter:

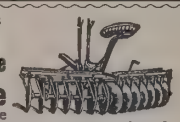
"Enclosed find $1.00 for renewal of subscription for another year. This will make the 10th year that we have been readers and always find something new, and to show what progress we have made in the dairy line by following your advice and everlasting sticking to it, will say that 10 years ago we were letting the calves run with the cow, and at the end of the year had a calf worth 7 to 10 dollars to help pay the board of the cow, which was $25, at least. With a full-blood Jersey sire at the head, for the past ten years,

GASOLINE ENGINES



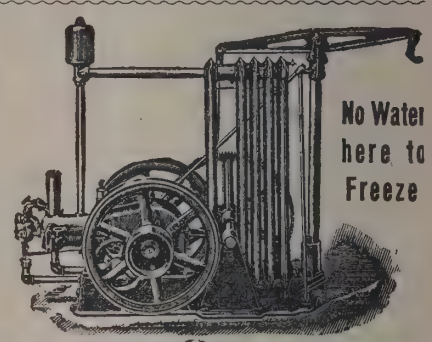
as power for the dairy have passed the experimental stage. Many dairymen now have them and all eventually must have them. The only questions to decide are the amount of power needed, and the most desirable make. With twenty-seven years of experience behind us, and a plant that has grown from 50 engines a year to 1500 a year capacity, we feel that we are equipped to build the best. There are other reasons why the "OTTO" is superior. We will tell them in this space from time to time. If in the meantime you need power, write us, mentioning this paper

THE OTTO GAS ENGINE WORKS, Philadelphia, Pa.



LAMBERT
Gas or Gasoline
Is the reliable engine. No long shut-down for repairs. Simple, economical. Easy to regulate speed. Strong guarantee.
Agents wanted. Write for catalog.
LAMBERT GAS & GASOLINE ENGINE CO., Anderson, Ind.

DON'T BUY GASOLINE ENGINES UNTIL YOU HAVE INVESTIGATED "The Master Workman," a two-cylinder gasoline engine, superior to all one-cylinder engines. Costs less to buy and less to run. Quicker and easier started; has a wider sphere of usefulness. Has no vibration, can be mounted on any light wagon as a portable. Weighs less than one-half of one-cylinder engines. Give size of engine required. Pleas mention this paper. Send for catalogue. THE TEMPLE PUMP CO., ESTABLISHED 1853. Meagher and 15th St., CHICAGO.



THOMPSON-LEWIS GASOLINE ENGINES
furnish the greatest possible power at the lowest possible cost in time, labor, fuel and money. They are so simple that anybody can run them without expert training or experience. Our Volume Governor gives uniform speed. Our Acme Mixer is the most positive and economical on the market. Our Hand Starting Lever starts engine with least effort. All bearings of Phosphor Bronze. Best material and workmanship throughout. Many sizes from 4 (actual) h. p. up. Best for all farm work—cutting and grinding feed, sawing wood, pumping water, separating cream, churning, etc. Send for our free catalog before you buy. It may save you time, money and annoyance.

MRS. LEA'S MILK AND BUTTER PURIFIER.

Removes all Weed, Garlic, Vegetable and Animal odor and taint from the milk and in no way injures the cow to which it is fed.

Dr. Jacob Michaux, Richmond, Va., and Dr. W. L. Robinson, Danville Va., Ex-Presidents of the Virginia Medical Society, write as follows: Gentlemen—Having been consulted by you with regard to your "LEA'S MILK AND BUTTER PURIFIER" we beg leave to state after many careful experiments that we are most favorably impressed with its value. From the standpoint of physicians we have no hesitation in saying that the milk from cows to which it is fed is acceptable to the delicate palates and stomachs of the sick in cases where ordinary milk is not borne. We, having a knowledge of the formula, further state that it is not in any way injurious to either the stomachs or systems of the animals to which it is fed, nor to the stomachs or systems of persons using the milk from such animals. We further believe from our knowledge of your preparation that it so favorably influences the digestion of the animal that it will prevent those abnormal fermentations which produce injurious chemical reactions in the secretions and milk of said animals. We advise that Sanitary Dairies be encouraged to use this product, as it furnishes a milk not only devoid of all vegetable and animal odors and flavors so objectionable and so frequently found in milk not thus treated but that it is a sweet and pure article for the table and for the use of invalids. [Signed] JACOB MICHAUX, M. D.
W. L. ROBINSON, M. D.

The Gem FIBRE PACKAGE.
The border of this advertisement is a section of the Package cut in half. It shows just how the Package is made. Note the three thicknesses of fibre in the walls. Note how the sides and the inside bottom are pressed and dovetailed together. Note how the whole is reinforced by the extra bottom. It's lined throughout with parchment paper. Treated as it is, it is impervious to moisture, mildew or mould. It will not sweat in warm weather and is slow to freeze in cold weather. It's the ideal market package for anything but is specially desirable for butter. Made in numerous convenient sizes. Illustrated booklet and samples mailed free.
THE GEM FIBRE PACKAGE CO.,
Dept. E, Gem Building, Detroit, Mich.

DON'T SEND A CENT Try a "1900" Washer for 30 days, free of all charges, freight prepaid both ways. The "1900" Ball Bearing Washer is the simplest, easiest machine ever made for washing clothes. Saves time, money and worry. Write at once to "1900" Washer Co., 219 A State St., Binghamton, N. Y.

NOW IS THE TIME TO SUBSCRIBE FOR **HOARD'S DAIRYMAN.**

our herd the past year brought us about $70 each."

From an income of *seven* dollars per cow annually to an income of *seventy* dollars per cow annually, in nine years, is a consummation that ought to set at rest every doubt as to the earning capacity of the special-purpose dairy cow. It ought also to provoke others to follow so good an example, which is, in brief: Get good advice, follow it, and everlastingly stick to it.

Our Special Elgin Letter.

ED. HOARD'S DAIRYMAN:—Butter remained firm at 28½ cents on the Elgin Board of Trade today. Union offered 40 tubs and Garden Prairie 60, asking 29 cents, and Newman's bid of 28½ was refused. The output for the week was 507,850 pounds. The Quotation Committee reported the market firm at 28½ cents. Former markets were:

	Sales.	Price.
March 16, '03	0	28½c.
March 24, '02	0	27c.
March 25, '01	40 tubs	21½c.
March 26, '00	0	24c.

The New York market remained firm at 29 cents. Recipts 5,700 tubs.

Elgin, Ill., Mar. 23, '03. H. C. B.

DAIRY MARKETS.

ELGIN, Ill., March 23—Butter—Six thousand pounds of butter offered, but none sold on the Board of Trade to-day. The market was declared firm at 28c½. Output of the week was 507,850 lbs.

CHICAGO, Ill., March 23—Eggs—Firsts, at mark, cases included, 13@13¼c; miscellaneous receipts, at mark, cases returned, 12½@12¾c; seconds, per case, $3.30; Duck eggs, per doz., 25c; goose eggs, 50c.

Cheese—Twins, per lb., 13@13¼c; Daisies, 13@13½c; Longhorns, 13@13½c; Swiss, 11½@15c; Brick, 11½@13c; Brick, 11½@12¼c; Young Americas, 13¼c.

Butter—Creamery extras, per lb., 27½c; firsts, 24@26c; seconds, 18@20c; dairies, 24c; packing stock, 12½@13c; ladles, 15c; process butter, 18c; June extras, 23c; roll, 13c.

Cattle—Plain beeves 1,200 to 1,400 lbs., 5.55@5.75; choice to extra beeves, 5.20@5.50; fair to good export and shipping steers, 4.60@5.15; medium beef steers, 4.10@4.50; plain to fair beef steers, 3.90@4.60; common and rough, 1,000 to 1,250 lbs., 3.30@3.80; good to choice heifers, 3.85@4.50; good to choice feeders, 4.00@4.90; poor to plain stockers and feeders 2.75@3.90; fair to good cows and heifers 3.30@4.20; good cutting and fair beef cows, 2.60@3.15; common to good canning cows, 1.60@2.50; veal calves, good to fancy, 6.10@7.25; corn fed Western steers, 3.65@5.85; veals, coarse and common, 3.25@5.85; Texas bulls and grass steers, 2.75@3.20. Texas steers, fair to choice, 3.75@4.60.

Hogs—Good to prime heavy shipping, 7.70@7.85; good to choice heavy packing, 7.60@7.80; plain to choice heavy mixed, 7.55@7.75; selected butcher weights, 7.65@7.80; assorted light, 150 to 195 lbs., 7.40@7.65; common to good light mixed, 7.35@7.55; thin to choice, 50 to 130 lbs., 6.85@7.10; stags and rough lots, 4.40@6.60.

KANSAS CITY, Mar. 23—Eggs—Weak; fresh Missouri and Kansas stock, 10¾c, cases returned; new No. 2 whitewood cases included, 11½c. Butter—Creamery, 21@25c; dairy, 19c.

BALTIMORE, Mar. 23—Butter—Firm unchanged; fancy imitation, 21@23c; fancy creamery, 29@30c; fancy ladle, 18@19c; fancy roll, 17@18c; good roll, 16@17c; store packed, 15@17c.

Eggs—Steady, unchanged, fresh, 14c.

Cheese—Firm, unchanged; large, 14¼@14½c; medium, 14⅝@14¾c; small, 14½@14¾c.

NEW YORK, March 23—Butter—The market was fairly active at a ruling price of 29c for extra creamery and 28½c for high scoring firsts. The arrivals were moderate and contained a very small percentage of fancy table stock. Creamery extras, 29c; state dairy, tubs, fancy, fresh, 27c.

Cheese—The market is on a strong and substantial basis, but prices are not higher. State full cream, small, fall-made, colored, fancy, 15c; state full cream, large do, 14½@14¾c.

Eggs—Further weakness developed this morning under enormous receipts of fresh stock. Trade was very active. State and Pennsylvania fresh-gathered firsts, 14¾c; western fresh-gathered firsts, 14¾c.

BOSTON, March 23.—Butter — Creamery, western, extra, 26½@27½c; western firsts, 25½@26¼c; dairy, 15@25c; imitation creamery, 17@20c; ladle, 16@17c; box and print, 20@28c.

Cheese—Choice, 14@14¼c; sage, 14½@15c; fair, to good, 10@12¼c.

Eggs—Near by, 19c; western selected, 15½c; fair to good, 14½@15c; Illinois, 15½c; western dirties, 14@14½c.

PHILADELPHIA, March 23.—Butter — Firm, good market; extra western creamery, 30@30½c; near by prints, 33c.

Eggs—¼c lower; fresh near by, western and southwestern, 14½c at the mark; southern, 14c at the mark.

Cheese—Quiet but firm; New York full creams, prime small, 14½@14½c; fair to good, 13½@14c; large prime, 14@14¼c; fair to good, 14¼@13¾c.

BALTIMORE MARKET.

BALTIMORE Md., March 19—Butter—The firm feeling noted in the market in our issue of last week has not abated any; but on the contrary, there is a firmer tone and prices on all choice to fancy offerings have been advanced. There has not as yet been any increase in the receipts. Extras continue in very light receipt, and at times the supply has been in sufficient for the demand. There has been a fair demand for well-kept storage creamery. Imitation creamery—There is a quick demand for choice to fancy invoices. There is a prompt sale awaiting all arrivals of choice fresh ladles, of which the supply is very light. Rolls—All lots of good to choice, arriving in good condition, meet ready sale. Store-packed—While in light receipt, the supply is about equal to the demand. Receipts of choice to fancy blocks and prints meet quick sale. The market closes steady and firm on all desirable fresh grades.

Creamery Separator, extras, 29½@30c; firsts, 28@29c; seconds, 24@26c. June Creamery, extras, 24c@25; firsts, 22@24c; seconds, 19@21c; Imitation Creamery, extras, 21@22c; firsts, 19@20c; seconds, 16@18c, Iowa & N. W. Ladle, extras, — firsts, 18c; seconds, 15@17c. Ohio & Indiana Ladle, extras, — firsts, 17@18c; seconds, 15@16c. Roll, Ohio, extras, — firsts, 15c; seconds, 13c. Roll, W. Va., extras, — firsts, 14@15c; seconds, 13c. Ohio Store packed, extras, —; firsts, 14c; seconds, 13c. West Va. Stored packed, extras, —; firsts, 14c; seconds, 12@13c. Creamery blocks (2-lb.) extras, 30@31c; firsts, 28@29c; seconds, 25@26c; Creamery prints (½-lb), extras, 31c; firsts, 29@30c; seconds, 26@28c: Md. Va. & Penna. Prints, extras, 2j@30c; firsts, 27@28c: seconds, 23@25c; Renovated Butter, extras, 19@20c; firsts, 17@at 18c; seconds, 15@16.

Eggs—With continued mild weather in all of the principal egg sections, the gatherings have been quite liberal; consequently there has been a considerable increase in the receipts; so far the supply has not been at all excessive, as the demand has been fully equal to the offerings; the market to day rules about steady at 14½ cents. Duck Eggs in active demand.

Cheese—Offerings and demand moderate; market firm on all choice to fancy stock.

N. Y. State—Cheddars, fine, 14¾@15c; choice, 14@14½c; fair, 13@13¾c; Flats, fine, 14½@14¾c; choice, 13½@13¾c; fair, 12½@13c; Small, fine, 14¼@14½c; choice, 13½@14c: fair, 12½@13; Ohio Flats, fine, 13¼@13¾c; choice, 12¾@13c; fair, 12¾@12½c; O. Picnic, fine, 13¾@14c; choice, 13¼@13½c; fair, 12½@12¾c; Swiss Cheese, fine, 15c; choice, 12½@13½c; fair, 11@12c.

For full particulars apply to agents Chicago & North-Western R'y 5-8p

HARD FACTS
ABOUT CREAM SEPARATORS.

The **HARD FACTS** which concern the intending purchaser of a cream separator—whether for factory or farm use—are briefly these:

That a DE LAVAL Cream Separator is as much superior to imitating machines as such other separators are to gravity setting systems.

That protecting patents make and keep them so—together with far greater experience and superior facilities in every way for cream separator manufacture.

That every big and experienced user of cream separators knows this and uses De Laval machines exclusively—both in factory and farm sizes.

That it is as foolish to-day to buy other than a De Laval separator as it would be to buy an old-fashioned mower if an up-to-date combined reaper and self-binder could be had for the same money.

For the land's sake—use Bowker's Fertilizers. They enrich the earth and the men who till it.

Methods of Barn Framing.

Big Frames, of 2x6 Timbers, Throughout.

ED. HOARD'S DAIRYMAN:—Forty years ago, a man contemplating the erection of a barn or other building as wide as 36 feet and a post of 20 ft., would consider nothing smaller than ten inches square for the frame, and the sills and lower ties would surely not be of less solidity than one foot square. These old frames were strong and fairly rigid, we

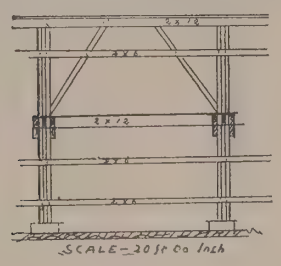

FIG. I.

must allow, though the frequent reports of barns blown down by gales seem to throw doubt upon their solidity

To erect a barn of the size and style shown in Figs. 3 and 4, called for a pile of scantling almost as large as is required to build a good sized wooden ship. Necessity is the mother of invention, and as big timber became scarce, architects and builders began to reduce the size of the scanttling. For many years, 4 inches was the thickest stick a builder would dare put in a frame of any size. The old manner of framing with cross ties tennoned into the posts and braces from these was still followed with the change, that instead of a wood tennon and mortise, a

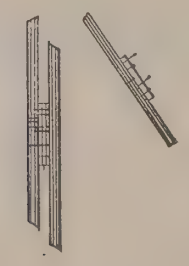

FIG. II.

bolt of iron was used, which was the first improvement in framing. Gradually tennoning and mortising were done away with by the best carpenters and bolts of iron with nuts and spikes, took their place. This is about as far as the majority of architects and carpenters have got yet.

When, a few years ago, the plank frame came before the public, many were skeptical of its utility, and are yet. Any doubt of its strength and general utility has passed away. But these so-called plank frames were, or are, apparently such a net work of planks, and from the fact also, that there appears to be no rule or system, or scientific method of framing, are, probably on this account, slowly coming into public favor.

The frame of the present day must of necessity be of light timber and to raise a structure of the light timber consistent with strength and freedom from net work of interior frams ties and braces is the question of the hour.

I believe these diagrams which I now place before the reader meet the needs of the hour, the great essentials viz: lightness of lumber, 2×6 stuff throughout, strength and rigidity and freedom from interior net work of timbers. The frame I call a brace frame from the fact that the whole frame is built of ordinary brace material, and from the manner of framing in which so many of the timbers act in the capacity of braces, or in looking on the frame the function of so many timbers appear to be that of braces.

Look at Fig 1, which shows a portion of the middle wall of this building. Notice that the posts are two thicknesses of 2×6 timber spread two inches and resting on stone pillars. Why space two inches? Can't you see the triple cross ties of 2×6 laid one above the other, making a 2×12 timber? See one of those 2×12s is placed in the 2 inch space in each of the posts. You can notice the ends in fig. 1.

The tie is spiked solid, and two other ties of the same material are spiked on either side. Here we have a tie of three thicknesses of 2x12s and with two space of 2 inches. Those tie spaces will later contain the purline posts and the upper and lower braces. See fig. 3.

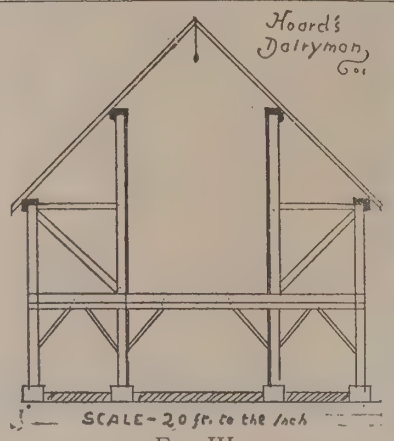

FIG. III.

The purline posts, like the brace posts, are two 2x6 scantlings and like the posts are placed with two 2-inch spaces in the cross-ties. These purlines have a plate-cap or fastening just like the main plate. The plate in figures 2 and 3, is two tiers of 2x6, spiked on top of the posts and fastened with two other ties of 2x6s in the lower edges of post tops —the drawings show very plainly.

There is only one cross-tie in these frames, and that is in the basement ceiling, some 8 to 10 feet from the floor, where it will never bother. It is braced below to both posts and purlines; and above, that is, between the purline posts, the center is open to the roof. Nothing here to obstruct you or to duck your head against—all clear to the roof. From top of post to cross tie, you notice a brace, that brace is but 2x6 pieces. Pretty small you say. It would be too small if the force exerted was pushing, but it is not. It is pulling, and your mathematicians will tell you how many times more the tensile strength of a crushing timber is, compared to its pushing strength.

Now notice the short tie from top of post to purline (Fig. 3.) That timber is double, that is, there are two of them, oftener three of them. Why three of them and only one of the braces adjoining? Because the strength of the upper cross-

GREAT POULTRY BOOK FREE...

Those of our people who are interested in poultry for profit should send for a free copy of the new 1903 book (No. 70) "How to Make Money with Poultry and Incubators," published by the Cyphers Incubator Company, Buffalo, N.Y. The greatest recommendation we can give this book is that it is the best thing the Cyphers Company has published. It consists of 196 pages, 8x11 ins.—contains 12 special chapters, covering the subject of Profitable Poultry keeping as follows; Starting with Incubators. Handling Chicks in Brooders. Feeding Chicks. Duck Producing on Large Scale. Broiler Raising. Profitable Egg Farming. Egg Poultry Combination. Egg and Fruit Farming. Scratching-Shed House Plans. Incubator Cellar and Brooding House Plans. Feeding for Eggs. Standard Bred Poultry. Each subject handled by an expert. 300 photographic views of largest poultry plants in United States, England, Germany, New Zealand and South America. Most valuable book of the kind ever issued. Write to-day for free copy and judge for yourself. Sixty pages devoted to complete illustrated description of Cyphers Non-Moisture Incubators, Apartment Brooders, Poultry Foods and Clover Products.

Cronk's Improved Staple Puller

is at the front. Ask your dealer to show it. Three wire cutters, two hammers, two splicing clamps—all in one tool. A staple puller that will pull staples when no other make will. A cutter that will reach wire when the button cutter will not. One day's use will save the cost of it. $1.00, postage paid.

piece is pushing, crushing, and thus needs to be many times stronger. Will that frame spread, will be the first thought, I apprehend. The long purline of doubled 2x6s is fastened a t or near the foot by two braces to the main cross-tie, rendering its end immovable. Now notice the long brace from its foot at cross-tie to top of plate. That brace prevents spreading at the plate, while the triple 2×6, from top of post to purline, resists the pushing or spreading force of the purline itself, and the weight of the roof exerted by the purline. No, this frame cannot spread. You may spike in another angular brace if you think a piece of 2×6 is not strong enough, but to do so, will be useless labor if the one stick is a sound one and well spiked. Now you would want to nail a tie—a collar beam—on the peak to keep the building from spreading. If you do that you spoil the principle of this frame. There is no need of it at all. That open centre from the floor to the peak is one of the beautiful characteristics of the frame.

We think no more need be said, as the drawing shows the style, principle and method very minutely. The posts are set on stone pillars, as shown in Fig. 3. The floor and adjacent foundation is built of concete. Sills have no place in a modern barn. For siding, strips of 2×6 are nailed sufficiently near for boarding, as shown in Fig. 1. Every spike in this frame counts and strengthifies. Twenty foot pieces are not needed. Short pieces of 2×6—any length — by splicing. See method of splicing. Fig. 2.

Now, see the plan of the big 60-foot barn (Fig. 4) with a post of 25 feet. That it takes your eye I apprehend, and you will be ready to say that this frame is stronger and better than the other,—is not as liable to spread. Not a bit; it is precisely on the same principle as the smaller with the exception that the cross-tie in the peak, joining the interior purlines, is made of a double tier of 2x6 binders.

That upper tie is certainly needed in so wide a barn as 60 feet. Here we have two sets of purlines, and our brace method is carried along upward; the principle however, is the same. The size of the timbers in the big building is the same, 2×6, but we double and treble them. When we use two in the smaller, we use three in the big, and so on. We want no timber bigger than 2x6. The roof on the big barn is a gambrel roof. On the small. er one(Fig. 3) the roof is an ordinary half pitch. J. A. M.

Moldy Ensilage.

ED. HOARD'S DAIRYMAN:—I saw in DAIRYMAN, March 13, that J. M. M. & S. had trouble in their silo of molded ensilage. Now I do not know how many cattle he has to feed from his 16×23 silo, but I judge by my own experience he does not feed it out fast enough or he has put the ensilage in too ripe. Both would have a tendency to make it mold. My advice to J. M. M. & S., is to cut the ensilage a little greener and put some poor hay on top, then some boards, then some stone and some sawdust around the edge and let it stand till cold weather. We cannot expect something good without some labor. Now go slow, do not let your ensilage get too ripe or dry, nor too green—better too green than too ripe to save the mold—and if your silo is tight, you will not have the mold that you speak of. N. P.

Springfield, Vt.

Effect of Spaying Cows on Milk Flow.

Information Wanted.

ED. HOARD'S DAIRYMAN:—We have been interested of late in the subject of spaying cows for the dairy. In my dairy I had the operation performed yesterday on one cow, which has of course as yet not sufficiently recovered to show the result. To-day she is very sore, off her feed and giving but little milk. However, she looks bright to-night and has begun to eat. Our idea is to treat all the cows in the dairy which are marked for ultimate disposal to the butcher in this manner. The cow marked as the next subject, is a large grade Short-horn, which has always given a good flow of milk until again in calf, when she would soon dry off and go four months or more to her next freshening. We expect the operation mentioned to hold her in milk longer, when we hope to have her ready for the butcher.

I write this letter hoping that you may be able to give some experience of others through your paper, along this line, which may be of assistance to us and any of your readers who may be interested in the subject. The question we would like most to have answered is: What has been the effect of the operation on the *quantity and duration* of the milk flow?

Batavia, New York. F. B. R.

The above inquiry is respectfully referred to such of our readers as have had experience along the lines indicated.

When is Milk From a Fresh Cow Fit for Food?

ED. HOARD'S DAIRYMAN:—If you will pardon for taking up this question for only a few words I will give an old method of determining when the milk from any fresh cow becomes good.

It is well understood that the first milk is provided for a special purpose and it gradually changes to "normal" milk in from two to four or five days. Some one found that when heat was applied to the milk of the first few days after parturition it would coagulate promptly. The test for the change to normal consists in boiling a little of the freshly drawn milk. It might be a spoonful in a large spoon or in a small dipper over a lamp. It is but a few moments work and if it boils without coagulating the change has occured and the milk is "normal." The change varies and as a rule it may be well to begin to boil milk from a healthy subject by the fourth or fifth milking.

A custom quite common in the south in early days, and in certain sections, now, allows the calves to luxuriate on the milk for a month or six weeks under the feeling that it was not fit for human food.

Bloomington, Ill. F. E. E.

ED. HOARD'S DAIRYMAN:—I often see inquiries in the papers, how to tell when to use the milk from fresh cows Take a little of the milk, after about the ninth milking, and boil it, if it is not good it will thicken. I have known cases where it was considerable time before it was good. R. A. B.

Mt. Sterling, Ill.

For Planting Corn and Cow Peas.

ED. HOARD'S DAIRYMAN:—Will you please ask the question, how many dairymen want a corn planter that will drop both corn and cow peas at once, but each one separate, and have a narrow opener in front of it? If we can't get one any nearer, we can get one at Chicopee Falls, Mass., but I would like to get one nearer at home. WM. H. B.

Concordia, Mo.

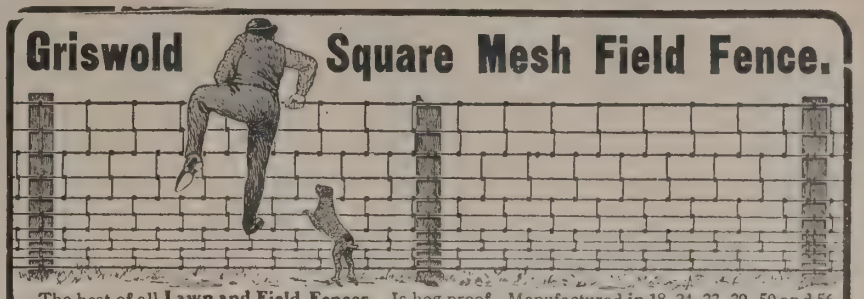
"ADVERTISEMENT."

BETTER SHOW

For Her Children Than She Had.

They will do it because they don't think carefully, but parents who give coffee to children reap their own punishment in the puny, sickly looking little ones.

Many and many a child has been started on the road to disease that ended in death, by being improperly fed and given coffee, which is a rank poison to many a highly organized human being.



A lady of Atlanta, Ga., says, "My mother was a slave to the whims of her children and let us eat and drink anything we called for, particularly she gave us coffee and lots of it.

I grew up delicate, nervous, half sick and miserable. When I was about grown I began having serious spells with my heart and my condition became so bad my friends decided I could not live long. At a consultation of physicians one of the doctors proposed that I discontinue coffee. This was years ago before Postum was discovered. I quit the coffee and in a year or two my heart was perfectly well.

Several years later when I had a home of my own I imagined that the stimulant of coffee might benefit me, so I started in on it and in a few days the old symptoms of heart trouble returned. I quit it and took up Postum Food Coffee for my morning beverage and the heart trouble disappeared. I find Postum aids my digestion and has helped to build up my whole system.

I now use it three times a day and give it to my children with the knowledge that it is a powerful, delicious liquid food instead of a pernicious poison." Name given by Postum Co., Battle Creek, Mich.

Griswold Square Mesh Field Fence.

A Special Purpose Butter Cow.

[Continued from page 151]

and heifers to. Mr. Ward predicts, by what he has seen of Forfarshire's get on the Island, that in bringing the bull himself to this country, Mr. Cooper will be found to have put the cap sheaf upon all of his glorious work as an importer. I can personally sympathize with Mr. Ward's enthusiasm for Mr. Cooper's splendid importation of last year containing a few of Forfarshire's get. I noticed and called attention to the fact how well they compared with their neighbors and it was no easy end to keep up in that array of the very cream of the Island of which the most numerous feature was the get of the Flying Fox, the half-brother of Forfarshire.

When it came to the sale, Flying Fox himself brought the top price, but the next bull in order of price was a young son of Forfarshire. The latter had no daughter in milk in the sale, but the Fox heifers in milk, which best pleased the bidders, were those whose udders and teats most closely resembled the lacteal machinery of old Rosette. There will be a lot of sons and daughters of Forfarshire and cows bred to him to be sold in this sale as well as the bull himself. Of course he will go into some great thoroughbred herd, but among his bull calves and through those to come from the cows bred to him, his quality may occasionally be secured at a price that the practical dairyman could well afford to pay.

Well selected bulls, springing from such stock as these four sales will distribute, are infinitely better for grading purposes than the cast-offs of less highly organized herds, and the advantage of an auction is that the price is fixed by the buyers and not by the seller. And it very often is a much lower price than it would be if the seller fixed it. Intrinsically good things are quite apt to be held pretty high at private sale the effort being to work off less valuable animals for the lower price. Even at a sale, as well represented as Mr. Cooper's was last year, many animals sold for less than they cost him on the Island, and they were all right too, and in some instances proved remarkably profitable to the buyers.

I think no experienced person would deny that an increase of only five per cent in butter yield, from a given unit of food, would be a very low estimate for a single cross of a well chosen Jersey bull upon the average cow used for butter making in the United States, nor that an increase of full fifty per cent occasionally takes place. Were it possible (as in time it will be) that the entire nine million cows used for butter making should receive even an average of only five per cent increase, the added value to the butter crop of the country would reach the tidy sum of $12,687,942.72, provided the price did not fall. Of course it would take a long time to so improve the entire butter-cow stock that the whole twelve millions of dollars would be added to the country's wealth. Think of the number of pure-bred bulls it would take to grade up nine millions of cows! But it will not take so very long for any individual dairyman, who chooses to go about it, to realize his share of it. And if he does it at once, he will have the advantage of getting his increase before the general improvement has been so extensive as to lower the price of butter. Jersey breeders need to push an aggressive campaign of enlightenment upon this subject among practical dairymen. A permanent market for bulls should be established that will command confidence and sustain the thoroughbred herds.

HARK COMSTOCK.

Reclaiming Sandy Lands for Alfalfa.

ED. HOARD'S DAIRYMAN:—If I have made any success of dairying, and I feel that I have, it is due almost entirely to the information I have received from your paper during the past 8 years, and while I have been a close student of dairy matters all these years I don't know as much to-day about such matters as I thought I knew eight or ten years ago. During these years my whole thought was how to make a small farm (70 acres) pay. Thanks to the teachings of the DAIRYMAN. I believe alfalfa and the silo have solved the problem.

But now I have a different proposition to consider.

I have just bought another farm of 240 acres joining the Michigan Agricultural College farm, of which I hope to make a stock farm for cattle, sheep and hogs. About 40 acres of this land is quite sandy; indeed, there are several knolls covering 8 or 10 acres that seem to be about all sand. This sandy land is nearest the buildings and has been over cropped and under fertilized until it is in bad shape, although I am told by old residents that this very land formerly raised large crops. The sand is of a yellow color, and has more or less humus in the top 8 to 10 inches. Can't say how far below surface the subsoil is, but not very close.

This land is from 8 to 15 feet above the Cedar river which flows along one side of it. I want to cover about 80 acres of this farm with alfalfa, sand lucerne, sandy vetch, or other leguminous crops as soon as possible.

I want to know how to treat this much abused sandy land to bring the best results in the least time.

My idea is to sow cow peas or sand vetch with perhaps some highly nitrogenous fertilizer for a starter, plowing the cow peas under in the fall and sow the ground to rye. I would plow the sand vetch under the second season, continue this, if necessary, until the weeds are killed or smothered, and enough humus and fertility is stored in the soil to grow sand lucerne on the higher and more sandy portions and alfalfa on the lower and less sandy levels. I have had no experience with any of these crops except alfalfa, and so am in need of advice. Balance of farm offers no unusual problems.

C. D. W.

Lansing, Mich.

C. D. W. appears to be headed the right way. Just what commercial fertilizer, if any, would best serve his purpose the professors at the Michigan Agricultural College could tell him much better than we could hope to do. Alfalfa needs good supplies of potash, and the Senior Editor of this paper has derived marked advantage from applying wood ashes on his fields. Lime is also needed if not already in the soil. Let us have some discussion on this subject by those who have experimented.

Suggestions for Enlarging a Barn and Stable.

ED. HOARD'S DAIRYMAN:—I enclose you a ground plan of the basement of our cow stable, which is 38×50 feet and perspective plan of the front or east end of the same. The north and east sides of the basement are solid stone walls with the exception of the 2 little windows one in the root cellar and the other on the stairs, both being on the east side. The stable is built on the west side of the road where the land slopes to the west, and which gives us an entrance right from the road onto the stable floor over the cattle, and then on the south side we have the cow yard which is on a level with the basement floor. The latter is entirely of Portland cement, including

PROSPECT HILL JERSEY HERD.
Mature cows yearly records are from 405 lbs. to 740 lbs. butter. YOUNG STOCK FOR SALE. Come and see them. Tuberculin Tested. F. H. SCRIBNER, Rosendale, Wis.

Exile of St. Lambert
—13657—
is the sire of more tested Jersey cows than any bull living or dead, and the number to his credit will probably never be equaled by any other bull. His dam was one of the largest milkers among Jerseys, and is the dam of the three year old cow with the highest year's milk record for that age. Exile's sire is the grand sire of the cow holding the highest milk record for a year.
The mid-winter sale lists include a few tested daughters of this great bull and several cows and heifers deep in the blood that produced this famous sire. If you wish to improve your herd, or to start one, you will probably never have a better opportunity than is here offered. If interested write for lists, and please specify whether bulls, cows in milk, or heifers, are wanted.
WINTERGREEN HILL FARM, Scottsville, N. Y

ST. OMER HERD
Offers young bulls fit for service, out of tested dams with good yearly records. Strong in Exile of St. L., King of St. L. and Stoke Pogis of Prospect. Reasonabe prices. JOS. T. HOOPES, Bynum, Md.

FOR SALE--Young Bulls from selected dams. Send full details, mentioning defects you wish to correct, blood lines, etc., and we will quote promptly, reasonably, with guaranteed description and full pedigree. Apply to
BILTMORE FARMS, Biltmore, N. C.

The Evergreen Farm Herd has for sale three or four A. J. C. C. heifers bred Also a few cows and some choice bull calves from two to six months old. Write for pedigrees and prices.
N. N. PALMER & SON, Brodhead, Wis.

READY FOR SERVICE
We are offering a solid color yearling Jersey Bull, 56 per cent blood of five of greatest Jerseys that ever lived; out of a young cow scoring 360 lbs. butter within a year, second season. Sound and all right, well grown and thrifty. A bargain at $100. For particulars address
E. E. STEVENS, North Madison, Lake Co., Ohi

the mangers. I would like your valuable assistance in giving me a plan whereby I can build an addition to the stable for 20 more cows with calf pens, and 4 horses, (3 single stalls and 1 box) carriage room for 4 carriages, also creamery and ice house and engine room. On account of selling the land and buildings on the east side of the road, I am obliged to have more room. I also intend to build another silo. J. A. D.

Wallingford, Conn.

We are unable to devise any better plan than to extend the present structure to the west fifty feet to accomodate cows and calves, and provide for horses and carriages on the floor above the basement. If possible, break through the wall on the north and put in some windows. We would not combine creamery and ice house with barn, but erect a separate building about midway, (if practicable) between house and barn. The ice house, also, should be by itself.

Scotch and American Ayrshires.

ED. HOARD'S DAIRYMAN:—I have recently received the report of the official milking tests of Ayrshire cows in Scotland for the year 1902, and have selected the five giving the highest record for butter, also the five giving the highest record in the Home Dairy test in the states for the year 1902, a comparison of which is of interest, all being official and supposed to be among the best of the breed in either country.

The natural conditions in Scotland are more favorable for a large dairy yield from the same cows than in America on account of the more uniform moisture in Scotland, and its consequent succulence of pasturage. The record in both countries shows a good degree of uniformity and a good class of dairy cows.

As the names of the individual cows in Scotland were not given, but their owners instead, I have adopted a uniform method. The report is for two consecutive milkings.

A Unique Ohio Meeting.

The Hart Jersey Herd Visited.

ED. HOARD'S DAIRYMAN:—Something quite unique transpired in Northern Ohio, the other day, which utterly disproves that Friday is an unlucky day, or 13 is a Hoodoo; but on the other hand, both are now associated with one of the pleasantest of occasions that has transpired in dairy circles for a long time. The story about it is like this: Mr. Frank Hart, of Cleveland, one of its most prominent merchants, has a large farm, near Painesville, with its accompaniment of fine, large barns, and well appointed belongings, not to mention his elegant summer home, and here are domiciled a very fine herd of over 100 Jerseys, made up of the choice selections of several of the bluest of the blue blood families from England and the Island. Probably no other herd in the United States contains so many strong individuals in both cows and bulls, as does this "Cherry Tree Farm" herd.

But the occasion was this: Mr. Hart had invited on that Friday, and the 13th at that, about forty of the most prominent breeders of Jerseys and dairymen in the state, to meet him that day and be his guests, and see his herd, and look over his farm. Among the notables present was ex-Gov. Hoard; Prof. C. S. Plumb, of the Ohio State Ag'l College; Prof. J. W. Decker, of the Ohio Dairy School; George E. Scott, the "Dairy Straw" man; Prof. Maybridge, of Adelbert College, and others of not less renown. The party congregated at the Forest City House, in Cleveland, where a special electric car was taken for the farm, 28 miles away. The day had promised rain, but soon cleared into the warmest and most pleasant of March days. The run to the farm was made up the famous Euclid Ave., through the palatial residence section of East Cleveland, through the unending grape farms of Euclid and Wickliff, along the famous Mentor ridge road, past the modest home of the Garfields, and finally on the Concord prairie we stop and are welcomed by the proprietor, and the crowd is soon sight seeing, and admiring the fine cows and young things, as well as a group of bulls, young and old.

No attempt will be here made to tell of the Golden Lad, Tormentor, St. Lambert, Stoke Pogis, Signal and St. Helier blood there represented, and some of the extreme top crosses exhibited, beyond this, that it was an opinion oft expressed, that another such herd of 100 in number could not be found in the United States. Mr. Hart seems to be an adept in every detail that pertained to the breeding and management of this herd, and it is a creation wholly of his, a result of an intense research and application to the study of Jersey cattle, and the result is flattering to him beyond common place compliments and set phrases. It is summed up in six words: "He is master of the art." At the conclusion of a two hours' inspection of herd and surroundings, the electric car was again boarded, and a two miles trip taken to the beautiful little city of Painesville, where at "The Parmely" a very fine noon lunch was spread, and for an hour as guests of Mr. Hart the bountiful repast was enjoyed, spiced with no end of jokes, Jersey talk, and social chat, that took quite wide range, even including President Roosevelt with his "refreshing independence."

Then there was a return to the farm, and individual inspection made of a score or more of the herd and an inspection also of the fine herd of nearly equal number of Jerseys of a close neighbor, Mr. Silverthorn. Then the car was boarded with city intention. On the homeward journey attention was called, and after a brief review of the day and its pleasures, and how thoroughly it had been enjoyed by all, by John Gould, that gentleman moved the heartiest vote of thanks possible to Mr. Hart, as a feeble expression of the appreciation on the part of the visitors for his kind and bountiful hospitality, and wishes for him for much good things in store for the future. The vote was carried with the heartiest of a three times one. Mr. Hart responded in well chosen words and went somewhat into detail as to the "working value" of his herd, and showed that valuable blue-blood cows were not too good for a commercial dairy and were yielding him a fine dividend, beyond the pleasure he received from the ownership of so fine a herd. "Public Square," said the conductor, and out into the blaze of the electric lights of a great city went the "forty-two," each for their own homes, carrying the recollection of a most pleasant day, and the other thought that the host was not only well named, but that, besides, he carried a greater heart, and the generous hospitality of the day was its best outward expression.

JOHN GOULD.

Western Reserve, O.

A Missouri Dairy Report.

ED. HOARD'S DAIRYMAN:—During the year 1902 we kept 7 cows, two of which were two-years-old, also 7 yearlings and 2 horses. Bought all our ground feed, which was very high: Corn, 75 cents per bushel; bran, $1.00 to $1.20 per 100 lbs.

The products of the 7 cows were as follows:

Milk sold at retail	$469.65
Milk, cream and butter used at home	50.00
Calves sold	22.35
Two calves on hand	15.00
Total	$557.00
Our total cash expense for corn and bran for the 16 head of stock was	79.80
Balance	$477.20

Our ration for our cows was wheat bran, corn meal, oat hay cut in the milk, and alfalfa, fed according to our best judgment, after following the instructions given by the best dairy paper we can find, HOARD'S DAIRYMAN. Our little herd of cows consists of 3 full blood and 4 grade Jerseys. Milk sold at 20 to 25 cents per gallon.

Alfalfa is one of the most important factors in our success.

C. H. T.

Elsberry, Mo.

Bermuda Grass for Pasture—Time to Dehorn.

ED. HOARD'S DAIRYMAN:—Have several 12 months-old heifers, Jerseys. What is the best season of year and at what age is best to dehorn them? Dehorned several 18 months-old heifers last fall, but notice their horns continue to grow until now horns or stubbs are about 2 inches long. Can this growth be stopped when dehorned at this age?

Have an old, very old pasture in wild grass. Would you advise me to sow Bermuda for pasture? What about Johnson grass for land you only want in future for pasture?

J. H. W.

Casky, Ky.

There is no special time for dehorning, any season will do, except in fly season If the horns have grown as long as you mention, it is best to dehorn them.

There seems to be a general dislike to sowing Johnson grass, owing to the difficulty of getting rid of it when once introduced, as it is like quack grass in its manner of growth with creeping root stalks that is almost impossible to eradicate. If there is absolute surety that the land will be wanted only for pasture in the future and that it can be prevented from spreading to other fields, Johnson grass might be sown, but not otherwise. Bermuda grass has the good qualities of Johnson grass and is also difficult to eradicate, but not to such extent. It is of little value north of Virginia, but where

The New 1903 REID HAND SEPARATOR

The 1903 Reid Hand Separator is the most exact milk skimmer ever made—it is simplest, fastest, lightest running, and affords most butter-producing material under all conditions. It creates a new source of revenue and maintains the income—

FARMER BRIGHTON, FAIRFIELD, IOWA.

it can be grown, makes excellent pasturage and produces large amounts of hay. We should hesitate to introduce such grasses where there is such an excellent native variety as the Kentucky blue grass, which in that locality, makes an ideal pasture. A thorough harrowing or disking of the old pasture, with a liberal top dressing of manure, and sow with blue grass, white and red clover, timothy, red top and perhaps orchard grass if there is much shade. Under the usual pasture conditions, a variety of grass will give better results than any one or two varieties.

Returns From Skim Milk.

ED. HOARD'S DAIRYMAN:—Having read in a recent issue of the DAIRYMAN of a creamery operator of Washington being dissatisfied with the way some were writing of their success and large returns from skim milk, I thought I would write my experience on the subject as a calf food. I started with rather a thrifty bull calf, on Nov. 2nd he was dropped, I fed him ten days on whole milk, after which I gradually reduced to skim milk and shorts; after fifteen days old he was confined to skim milk and shorts with what oat hay he cared for, which was 375 lbs., or 1½ bales from that time until he was killed, during which time I fed him three bags or 255 lbs. shorts which was mixed with the milk always and in no other way. On the 21st day of August I killed him, and he dressed 333 lbs. I sold the front quarters for 10 cents per pound or $16.30; the hind quarters we made use of at home, and if any one thinks the meat is not first-class, he is laboring under a wrong impression. I sold the hide for $2.00 and considered my calf worth $35 36. As to cost of feed:

255 lbs. shorts at $1.05 per cwt	$2.67
375 lbs, hay at 40 cents per cwt	1.50
Cost of hay and grain	$4.17

Now we have $31.13 left for our skim milk, which I am sorry to say I am unable to give an accurate account of, but to the best of my judgment it is in the neighborhood of 27½ or 28 cents per cwt. I raised 17 heifer calves; sold $94 worth of hogs and raised a number of young ones and all from 17 cows. As a food for calves I think separated skim milk, if properly handled and fed, is very valuable, but must not be fed in large quantities to young calves, under six weeks old. It is my opinion that three-fourths of the trouble arising from scours is from that cause. J. H. POTTER.

Shellville, California.

Milk for a Gallon of Cream.

ED. HOARD'S DAIRYMAN:—What is the standard pounds of milk to make a gallon of 25 per cent cream?

CITY CREAMERY.

Montgomery, Alabama.

There can be no definite or standard number of pounds of milk to make a gallon of cream, as it will vary according to the richness of the milk. A gallon of 25 per cent cream will contain 2.02 lbs. of fat, and to make this amount will require 5.9 gallons of 4 per cent milk and 4.7 gallons of 5 per cent milk, and milk containing different per cents of butter fat in proportion.

Returns from a Wisconsin Holstein Herd.

ED. HOARD'S DAIRYMAN:—I send you a report of my herd of thoroughbred Holstein cows for the year of 1902, which might be of interest to the many readers of HOARD'S DAIRYMAN. I should like to see more of the dairymen give a report of what they are doing. I think it would be a good way to help to advance dairying. It would help to make a strife among the dairymen to see who could make the best average. I deliver my milk to Brick cheese factory. I get for my milk 80 cents to $1.10 per hundred. The number of cows milked is ten. Number of pounds of milk delivered to factory, 82,756.

Cash received for the same	$762.08
Six calves sold	79.35
Four calves raised, valued when dropped	60.00
Milk taken for family use	14.00
Value of whey	105.00
Total amount	$1,020.43
This makes average per cow	$102.04
